June 2022

ACV

**THE KINGBIRD** (ISSN 0023-1606), published quarterly (March, June, September, December), is a peer-reviewed publication of the New York State Ornithological Association, Inc., which has been organized to further the study of bird life and to disseminate knowledge thereof, to educate the public in the need for conserving natural resources, and to document the ornithology of the state and maintain the official *Checklist of the Birds of New York State*.

Members of NYSOA receive *The Kingbird* and the newsletter *New York Birders*. Membership is available in the following annual dues categories, for the period 1 January through 31 December:

	<b>Electronic Publications (via email)</b>	<b>Paper Publications (via postal service) US / Canada or Mexico / Any Other Country</b>
<b>Individual</b>	\$30	\$40 / \$50 / \$60
<b>Family</b>	\$35	\$45 / \$55 / \$65
<b>Contributing</b>	\$50	\$60 / \$70 / \$80
<b>Kingbird Club</b>	\$100	\$110 / \$120 / \$130
<b>Student</b>	\$20	\$30 / \$40 / \$50

- Join or renew online at [nybirds.org/membership](http://nybirds.org/membership).
- Information for clubs and organizations is available on the website, or email [president1@nybirds.org](mailto:president1@nybirds.org) for membership information.
- Institutional subscriptions to *The Kingbird* are \$50 annually: [subscriptions1@nybirds.org](mailto:subscriptions1@nybirds.org).
- All amounts stated above are payable in US funds only, with checks payable to NYSOA.
- Requests for single copies and back issues (\$5.00 each): New York State Ornithological Association, Inc., P.O. Box 25, Long Lake, NY 12847.
- Send address changes to: [membership1@nybirds.org](mailto:membership1@nybirds.org).

## REPORT OF THE NEW YORK STATE AVIAN RECORDS COMMITTEE FOR 2018

The New York State Avian Records Committee (hereafter “NYSARC” or the “Committee”) evaluated 80 submissions involving 59 occurrences of New York State review species from 2018 and an additional one from 1984. Reports were received from across the state, with 25 of the 62 counties and the pelagic zone represented. The number of reports accompanied by photographs remains high and naturally benefits the value of the archive. The Committee wishes to remind readers that reports submitted to listservs, local bird clubs, rare bird alerts (RBAs) and even the *Kingbird* Regional Editors are not necessarily passed along to NYSARC. Doing so, therefore, remains the responsibility of the observer(s). The best way to ensure a rarity is reviewed by NYSARC is to submit a formal report to the Committee, which would include written details and possibly photographs or audio recordings. Submitting an acceptable report to eBird also works, although NYSARC review of eBird reports may lag slightly behind reviews of formal submissions. As is well-known by now, the use of the Internet and mobile phones has had a very positive impact on the timely dissemination of rare bird sightings and has made it easier for birders to locate rarities found by others. The Committee has always held that receipt of multiple independent reports provides a much fuller documentation of the sighting and can in some cases increase the likelihood of acceptance. We therefore urge ALL observers, not just the finder, to submit written reports and/or photographs. The names of the 52 contributors that submitted materials (written reports, photographs, video and audio recordings, and sketches) are listed alongside accepted reports and again at the end of this document. Where possible, the name(s) of the original finder(s) is (are) included in the narratives. Production of this Annual Report is a team effort. In addition to the contributors referenced above, some *Kingbird* Regional Editors and eBird reviewers have helped observers to prepare and submit documentation.

### HOW TO SUBMIT REPORTS

Advice on how to prepare and submit a report is provided on the NYSARC pages within the NYSOA web site: <http://nybirds.org/NYSARC/index.htm>. Although it may go without saying that photographs and/or audio recordings of the reported bird(s) can be vitally important to getting a record accepted by the Committee, it cannot be emphasized enough that a thorough written description of the bird(s) and the circumstances of the observation, as well as other pertinent details, can also propel a record to acceptance. Unfortunately, eBird reports are frequently very short on details and when those reports also lack hard evidence, such as photos or audio recordings, it becomes difficult for the Committee to accept them. ***This highlights an important distinction between NYSARC and eBird.*** Some eBird reports are accepted by eBird reviewers in large part because the observer

is considered experienced. While NYSARC may consider the observer's experience, we want accepted records to have archived documentation that can be reviewed by anyone in the future. As such, some reports from very experienced observers that have few or no substantial details and which were accepted by eBird reviewers, will not be accepted by NYSARC.

Also on the NYSARC pages is a list of species requested for review by NYSARC (The Review List) as well as illustrated copies of previous annual reports. The Committee is very grateful to Carena Pooth (NYSOA Web Master) for updating and continuously improving the NYSARC web site. An on-line reporting form allows observers to compose a written report and attach up to three digital image files (maximum size 7 MB per photo). Documentation (written reports, photographs, audio recordings) and any other correspondence for the Committee can also be sent via email to the NYSARC Secretary, Gary Chapin, at: nysarc44@nybirds.org. As a last resort, you can also use regular mail to get your report to: Gary Chapin, 125 Pine Springs Drive, Ticonderoga, NY 12883

## HIGHLIGHTS

For the first year since 2009, there were no new additions to the state list in 2018. The highlights included the third NYS record of Wood Sandpiper (*Tringa glareola*), only the second records of Trindade Petrel (*Pterodroma arminjoniana*) and Roseate Spoonbill (*Platalea ajaja*), the fourth of Green-tailed Towhee (*Pipilo chlorurus*), and the fourth for Kirtland's Warbler (*Setophaga kirtlandii*).

## COMMITTEE NEWS

The 2018 annual meeting was held via Skype on 21 Mar 2020, six months after the 2017 annual meeting. Note that the annual meeting year refers to the latest reports reviewed at that meeting. After the first round of review, 12 formal submissions were left for additional discussion and voting. Three of those were settled using email discussion, prior to the meeting, and the remaining nine were completed either during the meeting or sometime later, after obtaining additional information and expert opinions.

Several potential changes to the review list were discussed at the 2018 annual meeting. The following changes were decided upon at the meeting:

- change "Greenland" Greater White-fronted Goose to upstate review only (U);
- change "Western" Greater White-fronted Goose to downstate review only (D);
- remove "Eurasian" Green-winged Teal from the review list;
- remove Summer Tanager from the review list.

Shortly after the 2018 annual meeting, the Committee decided to change Arctic Tern to upstate review only (U). This species presents significant identification problems for most birders, which was the main reason that it has been kept on the review list for downstate areas and the pelagic zone. The only area where the

Committee did not request documentation for this species was Cupsogue County Park in Suffolk County, where there has been an established pattern of occurrence for many years. However, over the past decade or so, more informed birders have documented the species occurring with some regularity on other outer beaches of Long Island as well. This enabled the Committee to remove Arctic Tern from the downstate and pelagic zone review lists.

## 2018 Reports Accepted

### **Black-bellied Whistling-Duck (*Dendrocygna autumnalis*)**

**2018-22-A** One, Calvert Vaux Park, **Kings**, 16 May (Joshua Malbin, ph J. Malbin). eBird 16 May

**2018-60-A** Two, Nissequogue River State Park, **Suffolk**, 23 Jun (Shaibal S. Mitra). eBird 23-28, 30 Jun, 1-5, 7-14 Jul

Alex Wilson found the Black-bellied Whistling Duck at Calvert Vaux Park, associating with Brant, in Brooklyn. The duck was apparently viewed on just this one day and only by a few observers. Joshua Malbin documented the record for NYSARC. The two birds at Nissequogue River SP were found by Jim Lafferty and stayed for three weeks.

### **Pink-footed Goose (*Anser brachyrhynchus*)**

**2018-10-A** One, Fort Miller, **Washington**, 21 Mar (Scott L. Varney)

**2018-61-A** One, Montauk Downs Golf Course, **Suffolk**, 4 Feb (Shaibal S. Mitra). eBird 16-18 Dec 2017, 11, 13-15, 19, 21-23, 28, 29 Jan, 4, 6, 8, 10-14, 17-19, 22, 24, 27 Feb, 1, 3, 4, 11 Mar 2018

The Fort Miller Pink-footed Goose was a first record for Washington County. It was found and documented by Scott Varney, continuing a trend of increasing records in the eastern portion of the state. The Montauk goose was apparently first found on 26 Nov 2017 by Bruce Horwith and stayed through most of the winter.

### **“Black” Brant (*Branta bernicla nigricans*)**

**2018-46-A** One, Fort Tilden, **Queens**, 19 Nov (Steve Nanz, ph S. Nanz)

This Brant, of the western North American subspecies, was found and nicely photographed by Steve Nanz. Although a few “Black” Brant have been found in New York in the past, it seems that this may be the first documented juvenile. Due to the close similarity between juvenile “Dark-bellied” Brant (*B. b. bernicla*) and “Black” Brant, the Committee studied photographs of the two forms, had a lengthy discussion about this bird, and solicited input from various goose experts. The reduced contrast between the neck sock and the breast shown by the Fort Tilden bird, particularly in the center of the breast, seemed to be a consistent difference from “Dark-bellied” Brant. Several Committee members noted this distinction as did some of the outside experts who responded to NYSARC’s request for opinions. After further discussion, the record was unanimously accepted by the Committee.

**White-winged Dove (*Zenaida asiatica*)**

**2018-47-A** One, Cupsogue Beach County Park, **Suffolk**, 30 May (Eric Zawatski, ph E. Zawatski). eBird 30 May

Eric Zawatski and Shawn Sullivan discovered this White-winged Dove at Cupsogue Beach, providing yet another briefly seen record of this southern species for the south shore of Long Island.

**Rufous Hummingbird (*Selasphorus rufus*)**

**2018-45-A** One, Rosendale, **Ulster**, 11 Nov (Robert P. Yunick, ph Annie Mardiney)

This hatching-year female Rufous Hummingbird was reported to be at the feeding station of Rob Johnson in Kinderhook, Columbia County, on 8-10 Nov. On 10 Nov it apparently had difficulty flying and Johnson was able to capture the bird by hand. It was brought to the facility of a licensed rehabilitator, Annie Mardiney, in Rosendale, Ulster County, where Bob Yunick was able to band the bird on 11 Nov. It was apparently doing well, flying and feeding inside of an enclosure at the time of his visit. Sadly, the bird passed away about two months later at the facility, even though it still seemed to be doing well (Annie Mardiney, pers. comm.). Unfortunately, the specimen was not preserved.

Although most of the Committee was in favor of accepting the record after the first round of review, two members wondered about the possibility that this could be a Broad-tailed Hummingbird (*Selasphorus platycercus*). After further discussion, the documentation was sent to Scott Weidensaul, Fred Bassett, and Sheri Williamson for their opinions. All three experts felt that the bird was, indeed, a Rufous Hummingbird. Williamson pointed out that there have been many examples of photographed birds in eBird that were identified as Broad-tailed Hummingbirds, which were actually Rufous, indicating that this is a difficult and widespread identification problem. In addition she pointed out that there is a broad hybrid zone between Rufous and Allen's Hummingbirds which may explain a lot of birds with intermediate or inconsistent measurements.

**Purple Gallinule (*Porphyrio martinicus*)**

**2018-3-A** One, Manorville, **Suffolk**, 13-15 Jan (Paul Sweet, ph Virginia Fratti)

**2018-4-A** One, Southampton, **Suffolk**, 16 Jan (Paul Sweet, ph P. Sweet)

**2018-41-A/B** One, Prospect Park, **Kings**, 20 Oct (Tim Healy, Zach Schwartz-Weinstein, ph T. Healy, Z. Schwartz-Weinstein). eBird 19-24 Oct

**2018-59-A** One, Rockville Centre, **Nassau**, 14 Jan (Paul Sweet, ph P. Sweet)

The immature Purple Gallinule at Prospect Park in Brooklyn was found by Sean Sime and seen by many over the course of six days in October. Three other Purple Gallinules were found in a short span during mid January on Long Island. The Manorville bird was reportedly seen for three days before being brought to a wildlife rehabilitator, where it soon perished. Unfortunately, the specimen was discarded by the rehabilitator. The Southampton bird was found by Pamela Chadderton and her husband but was not well and died the same day. The specimen is now American Museum of Natural History (AMNH) Skin #844181. The Rockville Centre bird was brought in to Volunteers for Wildlife on 14 Jan

and died on 16 Jan. This specimen is now AMNH Skin #844182. All three of the Long Island records were submitted by Paul Sweet. One more Purple Gallinule was reported in New York during the winter spate of sightings, a bird found on 25 Jan in Lewis County, where it was captured and taken to a rehabilitator (eBird Feb 2021). NYSARC will review that report at a later date.

### **Ruff (*Calidris pugnax*)**

**2018-14-A** Two, Port Byron, **Cayuga**, 12 Apr (Dominic Sherony, ph D. Sherony). eBird 10-12, 14, 16 Apr, 6 May (male); 12, 14, 15, 20 Apr (female)

**2018-52-A** One, Heckscher State Park, **Suffolk**, 22-23 May (Patricia Lindsay, ph P. Lindsay). eBird 22-24 May

In 2018, Montezuma NWR and vicinity was graced with the presence of two Ruffs, a male and a female-type. The black and chestnut male molted from transitional to spectacular full alternate plumage from 12 Apr to 6 May. The male was discovered by Gregg Dashnau and the female-type by Robert Spahn. A Ruff found in August of the same year in the same general area (eBird Feb 2021) will be reviewed by NYSARC at a later date. Pat Lindsay was birding one of her local shorebird patches, Heckscher SP, actually hoping to find a Ruff, when she came across another chestnut and black male, proving that following one's instincts can indeed pay off. This marks the fourth occurrence of this species since 2013 at the two adjacent sites of Heckscher SP and Timber Point Golf Course.

### **Wood Sandpiper (*Tringa glareola*)**

**2018-51-A/B** One, Great River, **Suffolk**, 16-17 Apr (Patricia Lindsay, Shaibal S. Mitra, ph P. Lindsay, S. Mitra). eBird 16-17 Apr

This mega rarity was discovered by Pat Lindsay at Timber Point Golf Course toward the end of a prolonged violent northeast storm. The identification was assisted by the efforts of Brent Bomkamp and Taylor Sturm, who tracked down the bird after it had flushed and disappeared, and Shai Mitra, who correctly suspected this species from the initial soft and distant photos Pat had managed.

This adult bird coming into alternate plumage constitutes only the third state record: an adult in basic plumage collected in Orleans Co. 10 Oct 1907 was the first, originally labeled a Solitary Sandpiper, then correctly identified in 1979 at the Museum of Vertebrate Zoology, University of California, Berkeley, Specimen #106848 (Dziadosz 1980, Burke 1998); then a juvenile was discovered at Rye, Westchester Co. 31 Oct 1990 by long-time Committee member Tom Burke (Burke 1991). Other records from eastern North America include one each from St. John's, Newfoundland 11-14 Nov 1998 (Mactavish 1999), Delaware 5-15 May 2008 (Veit *et al.* 2008), Rhode Island 12\*-30 Oct 2012 (Ellison *et al.* 2013), and New Jersey 20-22 Sep 2020 (Davis *et al.* 2021). There are also four from Bermuda (19 Oct 1981, 20 Apr 1983: Amos 1991; 11 May 1996, 12 Nov 2011: eBird 2021) and no fewer than five from the small island of Barbados (16 Oct 1955, 15 Nov 1992, 5 Mar 1994, 25 Apr 1998, and 28 Nov 1998), at least one, and probably several of which overwintered (Buckley *et al.* 2009).

\*The date of discovery is stated incorrectly as 13 Oct in the cited report. The bird was actually found and seen by many on 12 Oct (eBird; Mitra and Lindsay, pers. comm.).

### **Short-billed Gull (*Larus canus brachyrhynchus*)**

**2018-2-A** One, Prospect Park, **Kings**, 20 Jan (Sean Sime, ph Michael Yuan, Geoffrey Jones). eBird 20 Jan

**2018-5-A** One, Floyd Bennett Field, **Kings**, 16 Mar (Sean Sime, ph S. Sime). eBird 16 Mar  
Sean Sime found these two adult gulls, both one-day-only sightings. His detailed description of the Prospect Park bird along with other observers' diagnostic photos, as well as his excellent report and photos of the Floyd Bennett Field bird, enabled identification as the then-subspecific race of Mew Gull, *brachyrhynchus*, now awarded full species status as Short-billed Gull by the American Ornithological Society (Chesser *et al.* 2021). Sime commented that the Floyd Bennett Field bird could possibly have been the same individual as the Prospect Park bird, but without conclusive evidence the Committee decided it was prudent to treat these as separate records.

As noted in the 2017 NYSARC report (D'Anna *et al.* 2021), records of "Mew Gull" have been increasing in recent years, quite notably within New York City. For many years, the default assumption for the species in coastal areas was the nominate European Common Gull (*L. c. canus*). However, there are now multiple documented individuals of the North American Short-billed Gull (*L. c. brachyrhynchus*). As an interesting side note, and further evidence that the Brooklyn waterfront continues to be a magnet for these rare gulls, another Short-billed Gull, determined to be a different individual, was found earlier in the same week as the Prospect Park bird at the nearby Veterans Memorial Piers (eBird 2021). This report will be reviewed by NYSARC at a later date.

### **Common Gull (*Larus canus canus*)**

**2018-13-A** One, Collins Lake, Collins Park, **Schenectady**, 15 Apr (Ted Keyel, ph T. Keyel). eBird 15 Apr

This adult Common Gull (known as Mew Gull, at the time of the sighting) was nicely photographed by the observer, Ted Keyel. His photos included the all-important shots of the spread wing but the Committee was initially somewhat uncertain of the subspecies involved, with some wondering if it could be the Russian subspecies, *heinei*, a potentially very significant record, as it has never been recorded in North America. After further discussion and an opinion from the European gull expert, Peter Adriaens, the Committee voted unanimously to accept this as the nominate, European race, which has since been split from the North American form and is now known as Common Gull.

### **Slaty-backed Gull (*Larus schistisagus*)**

**2018-1-A/B** One, Oswego, **Oswego**, 16 Jan (Kevin McGann, Bill Purcell, ph K. McGann, B. Purcell). eBird 16-19, 23, 25, 31 Jan, 6, 7, 16-19 Feb

David Wheeler found this adult Slaty-backed Gull on the Oswego River at Lock

6. Since the first New York record, in 1992 on the Niagara River, this Asian species has been recorded at least 16 times in the state. One cannot say that it was expected or even considered that plausible in 1992, as it was the first record in North America east of the Mississippi River (Brock 1998). Thus, this change in status for a species that does not breed in North America is truly remarkable.

### **Bridled Tern (*Onychoprion anaethetus*)**

**2018-36-A/C** One, Great Gull Island, **Suffolk**, 3-16 Aug (Sean Sime, Joseph DiCostanzo, Arie Gilbert, ph S. Sime, J. DiCostanzo, A. Gilbert). eBird 3-16 Aug

For the third consecutive summer, the Great Gull Island tern colony was favored by the visit of a Bridled Tern, presumably the same individual each year. Although the island is off limits, except to tern researchers, a number of birders made boat trips to view the bird from offshore.

### **Least Tern (*Sternula antillarum*)**

**2018-32-A** One, Braddock Bay, **Monroe**, 8 Jul (Dominic Sherony, ph Joseph Wing). eBird 8 Jul

Discovered by Jim Miles and Lauri Mattle, this Least Tern entertained a few dozen birders on the one day that it was seen. Though a regular coastal breeder, Least Tern is an exceptional rarity inland in New York, with only three records reviewed and accepted by NYSARC.

### **Arctic Tern (*Sterna paradisaea*)**

**2018-26-A** One, Plumb Beach, **Kings**, 19 May (Peter Paul, ph P. Paul). eBird 19 May

**2018-28-A** One, Nickerson Beach, **Nassau**, 17 Jun (Tim Healy, ph T. Healy)

**2018-29-A/C** One, Nickerson Beach, **Nassau**, 16, 19 Jun (Joshua Malbin, Zach Schwartz-Weinstein, Shaibal S. Mitra, ph J. Malbin, Z. Schwartz-Weinstein, S. Mitra)

**2018-30-A** One, Breezy Point, **Queens**, 12 Jun (Peter Paul, ph P. Paul). eBird 12, 13 Jun

**2018-55-A** One, Nickerson Beach, **Nassau**, 23 May (Shaibal S. Mitra, ph S. Mitra)

**2018-56-A** One, Nickerson Beach, **Nassau**, 10 Jun (Shaibal S. Mitra, ph S. Mitra)

**2018-57-A** One, Nickerson Beach, **Nassau**, 25 Jun (Shaibal S. Mitra, ph S. Mitra)

2018 was a good year for this species, most notably at Nickerson Beach, where five individuals were documented for NYSARC, including four by Shai Mitra. Shai is the person most responsible for educating birders on where and when to look for this species, as well as how to identify it (see Mitra 2009). As many birders know, field separation between Common and Arctic Terns can be very challenging. 2018 also saw the first two records of Arctic Tern for New York City that were accepted by NYSARC, both nicely documented by Peter Paul: an adult at Plumb Beach and a first-summer bird at Breezy Point. In addition to the reports submitted to NYSARC, there were four other identifiably different individuals at Nickerson Beach, eBirded on 6, 15, 18, and 24 Jun, and 11 other individuals reported to eBird from Old Inlet, Cupsogue CP, and Triton Lane, all Suffolk County, 9-28 Jun, these carefully vetted and documented by Shai Mitra (Mitra and Lindsay 2018). Due to the now well-documented regular occurrence of Arctic Tern on the barrier beaches along the south shore of Long Island, the Committee decided to remove the species from the review list for the downstate areas. Even

so, occurrence of this species varies greatly from year to year; observers should not expect it to be as easy to see as 2018's bounty might imply, and should always strive to obtain photos and provide detailed descriptions.

### **Sandwich Tern (*Thalasseus sandvicensis*)**

**2018-31-A** One, Nickerson Beach, **Nassau**, 19 Jun (Zach Schwartz-Weinstein, ph Z. Schwartz-Weinstein) eBird 19 Jun

**2018-53-A** One, Robert Moses State Park, **Suffolk**, 22 Jun (Shaibal S. Mitra, ph S. Mitra)  
The immature Sandwich Tern at Nickerson Beach was found by Doug Futuyma when it flew into his scope view! It was only seen by a few observers. The Sandwich Tern at Robert Moses SP was picked up by Shai Mitra during a seawatch and likewise was seen by just a few observers as it flew past.

### **Trindade Petrel (*Pterodroma arminjoniana*)**

**2018-37-A/C** One, Hudson Canyon, **Suffolk**, 20 Aug (Sean Sime, Tim Healy, John Gluth, ph S. Sime, T. Healy, J. Gluth). eBird 20 Aug

Attracted to the chum slick on this SeeLife Paulagics trip out of Brooklyn, a light morph Trindade petrel remained for several minutes, allowing for stunning views, great photos, and the opportunity to safely rule out other *Pterodroma* species. Just the second documented record for New York State, this spectacular highlight was nevertheless to some extent anticipated, based on the species' increasingly frequent detection in the Gulf Stream waters off Cape Hatteras, North Carolina, over the past 30 years. In contrast, New York State's only prior record, which was also the first for North America, made little sense at the time. Found in a farm field in Tompkins Co. after the Hurricane of 1933 (Bull 1974), this record seemed for decades almost as outlandish as the enigmatic Mottled Petrel from Livingston County in April 1880 (Bull 1974), or the still-unresolved Hawk Mountain *Pterodroma* of 3 Oct 1959 (Carboneras *et al.* 2020). But vastly improved offshore coverage has revolutionized our understanding of one species after another, such that the once almost completely unknown Black-capped Petrel is now expected on carefully planned New York pelagics, and future occurrences of Trindade Petrels here are considered tantalizingly likely.

### **Brown Booby (*Sula leucogaster*)**

**2018-34-A** One, Pelagic, **Suffolk**, 30 Jul (Charles A. Witek III). eBird 30 Jul

This Brown Booby was seen as it flew past a shark-fishing boat by the captain, about ten miles off the south shore of Long Island. Reports of this species have clearly increased in these more northern realms in recent years.

### **Anhinga (*Anhinga anhinga*)**

**2018-33-A/C** One, Morningside Park, **Sullivan**, 23, 29 Jul (Richard Guthrie, John H. Haas, Kenneth M. McDermott, ph R. Guthrie, J. Haas). eBird 23, 29 Jul

John Haas was kayaking on Morningside Lake, looking for shorebirds, when he came across what he assumed was a Double-crested Cormorant, which he photographed. Immediately after reviewing his photos, he realized that it was an

Anhinga! Other birders were able to see this mega-rarity the same day but not afterwards, until Haas himself found it again. In this latter observation the bird was in flight, gaining altitude as it circled over the lake. It was never seen again. This is only the fourth record reviewed and accepted by NYSARC.

**Roseate Spoonbill (*Platalea ajaja*)**

**2018-35-A** One, Wallkill River NWR, **Orange**, 3 Aug (Kenneth M. McDermott). eBird 29 Jul, 2, 3, 5 Aug

Most sightings of this bird were on the New Jersey side of the wildlife refuge. On a few occasions, however, it was seen on the New York side, including one sighting where it was photographed over Oil City Road (eBird Mar 2021). The total range of dates that the spoonbill was reported was 22 Jul to 6 Aug, with dates that it was found on the New York side shown above (eBird Mar 2021). This is only the second record in the state, with the first occurring on 20 Aug 1992. Prior to 2018 the New York record appears to have been the most northerly of the records shown in eBird. In 2018 there was a remarkable incursion of this species northward. In addition to New York, records in 2018 came from the following states, several with multiple locations: Maine, Connecticut, Pennsylvania, New Jersey, Delaware, Maryland, Virginia, West Virginia, Ohio, Indiana, Illinois, Missouri, Iowa, and Minnesota (eBird Mar 2021).

**Swallow-tailed Kite (*Elanoides forficatus*)**

**2018-17-A** One, East Northport, **Suffolk**, 28 Apr (Dennis Nowak)

**2018-19-A** One, Derby Hill Bird Obs., **Oswego**, 12 May (Joseph Brin). eBird 12 May

Both of these records involved birds flying over. The Northport bird was viewed by Dennis Nowak as it circled overhead briefly. The Derby Hill bird was seen by several people at this renowned hawkwatch, first spotted by Joe Brin. Records of this species have been increasing in the northeast, including many, like these two records, that would be classified as a “spring overshoot”, that is, a species that was spurred to migrate northward in spring but continued beyond the normal range of its breeding grounds.

**Mississippi Kite (*Ictinia mississippiensis*)**

**2018-18-A** One, Stony Point, **Rockland**, 5 May (Alan Wells, ph A. Wells). eBird 5 May

**2018-21-A** One, Hempstead Lake State Park, **Nassau**, 9 May (Rich Kelly, ph Sheila Meehan). eBird 9 May

**2018-24-A** One, Hempstead Lake State Park, **Nassau**, 28 May (Tim Healy). eBird 28 May  
All three of these records involved birds flying over during May. Two were supported by excellent photographs. Although it is possible that the two records from Hempstead Lake involved the same bird, that does not seem very likely given the nearly three week separation of sightings at a heavily birded site. As with the Swallow-tailed Kite, most spring sightings of this species are considered overshoots from their more southerly range. It should be noted, however, that as spring overshoot records continue to increase, the possibility of another pair staying to breed in the state increases as well.

**Boreal Owl (*Aegolius funereus*)**

**2018-16-A** One, Owl Woods, Braddock Bay WMA, **Monroe**, 25 Apr (Dominic Sherony, ph D. Sherony). eBird 25 Apr

This Boreal Owl was found by Nick Pusateri and his survey team at the renowned “owl woods” at Braddock Bay. A number of birders were able to see this owl, though it only stayed for one day.

**Gyr Falcon (*Falco rusticolus*)**

**2018-48-A** One, Point Peninsula, **Jefferson**, 27 Dec (Gerald A. Smith, ph G. Smith)

**2018-50-A** One, West Chazy, **Clinton**, 24 Dec (Derek H. Rogers, ph D. Rogers)

Seeing a Gyr Falcon is a thrilling experience, even for the most experienced birders. Veteran birder and hawk-watcher, the late Gerry Smith, had the rare opportunity to study an apparent adult gray-morph bird at length at Point Peninsula in Jefferson County, even hearing the bird call in response to a Northern Harrier flying overhead which dropped its talons. Along the shore of Lake Champlain, Derek Rogers, another veteran birder who has extensive experience with Peregrine Falcons, immediately knew he had something different when he saw this large long-tailed falcon flying towards him. A brief look in binoculars convinced him that he was looking at a white-morph Gyr Falcon. Hurriedly, he jumped out of his vehicle and managed a few photos of the falcon, providing very helpful supplementary documentation. The photos show the underside of the body and wings as it is flying away and it is obvious that the bird is a very pale large falcon. Rogers indicated that less than a half-mile from his sighting and two days later, a perched white-morph Gyr Falcon was photographed by Tara Fuller, almost certainly the same bird.

**Ash-throated Flycatcher (*Myiarchus cinerascens*)**

**2018-54-A** One, Heckscher State Park, **Suffolk**, 31 Oct (Shaibal S. Mitra, ph S. Mitra). eBird 31 Oct-1 Nov

Joan Quinlan found this Ash-throated Flycatcher which lingered for only two days at Heckscher SP. A fairly reliable if very scarce annual migrant on the coast, this species is still quite rare, and deserves special scrutiny to rule out other even rarer *Myiarchus* species.

**Gray Kingbird (*Tyrannus dominicensis*)**

**2018-44-A/B** One, Jones Beach State Park, **Nassau**, 10 Nov (Peter Reisfeld, Tim Healy, ph P. Reisfeld, T. Healy). eBird 10 Nov

Peter Reisfeld and Bobbi Veltri discovered this one-day-wonder Gray Kingbird at Jones Beach, which a few birders were able to tick off their lists. As with the great majority of records of this southern breeder in New York, the bird was recorded during the fall, likely a “reverse migrant”.

### **Scissor-tailed Flycatcher (*Tyrannus forficatus*)**

**2018-39-A/D** One, New Scotland, **Albany**, 08-14 Oct (Zach Schwartz-Weinstein, Scott Stoner, Kenneth M. McDermott, Thomas Williams, ph Z. Schwartz-Weinstein, S. Stoner, T. Williams). eBird 8-14, 16-18 Oct

**2018-42-A/B** One, Montauk, **Suffolk**, 20-21 Oct (Tim Healy, Patricia Lindsay, ph T. Healy, P. Lindsay). eBird 20-21, 28 Oct

The Albany flycatcher was found by Larry Alden and enjoyed by many over its 11 day stay. The Montauk bird, found by Joe Giunta, appeared two days after the upstate bird went missing, and there was some speculation that it might be the same bird. Tim Healy's report suggests that this would have been quite a feat for the flycatcher to have traveled so far in that time period, and that broad weather patterns and favorable conditions for vagrancy may have been more of a factor, a sentiment that many experienced birders agree with.

### **Northern Wheatear (*Oenanthe oenanthe*)**

**2018-43-A/B** One, Heckscher State Park, **Suffolk**, 28, 30 Oct (Tim Healy, Patricia Lindsay, ph T. Healy, P. Lindsay). eBird 28-30 Oct

This accommodating rarity, found by Lisa Nasta, was not put off by the hordes of birders that descended upon the site as news spread through emails, apps, and phone calls. It stayed faithful to a rather restricted area of the park for three days, hawking insects from low perches along the median and roadway. A highly stereotypical mid- to late-September vagrant in the state, and occasionally found into mid-October, this bird was somewhat notable in its late October appearance.

### **Golden-crowned Sparrow (*Zonotrichia atricapilla*)**

**2018-49-A/D** One, Downsville, **Delaware**, 30 Dec 2018-5 Jan 2019 (Lance Verderame, John Haas, Kenneth M. McDermott, Tim Healy, ph J. Haas, T. Healy). eBird 30 Dec 2018, 2-6, 8-13, 16, 18, 19, 26 Jan, 10, 17, 24 Feb, 2, 3, 6, 9, 17 Mar, 6 Apr 2019

While scouting for the local Christmas Bird Count, Lance Verderame made the exciting discovery of this immature Golden-crowned Sparrow. He contacted John Haas, who was able to document the bird with photographs. The bird was likely seen by hundreds of birders during the course of its stay, which was for over three months. In an article in *The Kingbird*, Verderame recounts the discovery of this bird and how he contacted the local residents and police to make them aware ahead of time of the crush of birders that might ensue (Verderame 2019). Verderame's forethought worked, as the local residents reportedly enjoyed the presence of the birders and, no doubt, the extra income that they injected into the local economy. If only all mega-rarity stories could end so happily.

### **Green-tailed Towhee (*Pipilo chlorurus*)**

**2018-6-A/B** One, Township of Montezuma, **Cayuga**, 13-14 Feb (Kevin McGann, Bill Purcell, ph K. McGann, Donna Carter). eBird 10, 11, 13, 14 Feb

Donna Carter had the pleasure of discovering this Green-tailed Towhee at her feeding station. The bird was seen over a five-day period but only sporadically visited the feeders. Although the bird appeared in eBird when found, the location was not mapped precisely. Despite attempts to find out by local birding leaders,

it was not known if the homeowner would be concerned about privacy should the sighting be made known to the statewide birding community. So, at least at first, the sighting was not made broadly public. As a result, relatively few birders had the opportunity to see the towhee. This was the first record of Green-tailed Towhee reviewed and accepted by NYSARC, and only the fourth confirmed record of this western species for New York, the last being in 1977 (Rising 1998). There is also a sight record, an unusual spring record from 1969 seen by multiple observers, which, given credence by Bull (1974), deserves mention.

### **Western Meadowlark (*Sturnella neglecta*)**

**2018-12-A/B** One, Savannah, **Wayne**, 14, 20 Apr 22 May (Joseph Brin, Doug Daniels, ph D. Daniels). eBird 14-30 Apr, 5-7, 10-14, 16, 17, 18-27, 29, 31 May, 4, 8, 9 Jul

Joe Brin heard an unfamiliar song coming from the field in front of him and soon discovered that it was a meadowlark making the vocalization. Checking with his Sibley app, he confirmed that the bird was a Western Meadowlark. The bird was seen in the area, apparently maintaining a territory, into July. However, there was a roughly five week gap in which there were no reports. This could be due to the bird singing less, as many birds do when they get to a certain stage in the breeding cycle. Without the aid of the distinctive song, many birders would have a difficult time identifying the species, though the call note differs from Eastern Meadowlark as well. Unfortunately, it is unknown if this bird had a mate and, if so, whether it was an Eastern or a Western Meadowlark. This is the first record in the state since 2007, when one was found in Chautauqua County (Wilson, *et al* 2009).

### **Kirtland's Warbler (*Setophaga kirtlandii*)**

**2018-20-A** One, Central Park, **New York**, 12 May (David J. Ringer, ph D. Ringer). eBird 11-13 May

New York's third accepted record for this formerly endangered species was found by Kevin Topping late in the day on 11 May, and delighted hundreds of birders by remaining cooperative for two more days. An adult male, this beauty sang readily as it foraged among the trees, often giving stunning views.

The above record is actually the fourth documented record for the state. A credible report from 18 May 2010, from Wilson, Niagara County, was submitted to NYSARC, but because it was a single observer sighting without a photograph, it precluded acceptance as a first state record. However, it is included in the 2010 report in the Supplemental category, which documents reports that are fully convincing but which fall short of the rigorous requirements for full acceptance onto the state checklist (Wilson, *et al.* 2012).

### **Western Tanager (*Piranga ludoviciana*)**

**2018-15-A** One, Prospect Park, **Kings**, 16 Apr (Peter Paul, ph P. Paul). eBird 16 Apr  
Peter Paul happened upon this bird late in the day, and managed a few photos during its two minute stay. This species has shown a pattern of almost annual fall and winter occurrence in the state, occasionally overwintering; however, it is rare

for this heavily birded park, and is only the second record documented in eBird for that location.

**Painted Bunting (*Passerina ciris*)**

**2018-25-A** One, Elmsford, **Westchester**, 31 Mar, 2 Apr (Julia Rogers, ph Adrian Rogers). eBird 2 Apr

Discovered and photographed by feeder watchers who were unfamiliar with the species, this green-plumaged bird was apparently not seen by any other birders. The homeowners forwarded the description and photos to the Cornell Lab Facebook page and to eBird for confirmation, and submitted this report to NYSARC at the suggestion of Tom Burke, which is much appreciated.

**2018 Reports Not Accepted**

**Barnacle Goose (*Branta leucopsis*)**

**2018-8-A** One, Town of Fayette, **Seneca**, 24 Feb

This was an unlucky situation where a birder found this bird at a distance but only had binoculars. He was pretty sure that it was a Barnacle Goose but could not be certain. He raced home for a spotting scope and returned, only to find that the geese had moved on. With the possibility that this could have been an aberrant-plumaged Canada Goose, which are not infrequent, the Committee reluctantly decided not to accept the record.

**Mississippi Kite (*Ictinia mississippiensis*)**

**2018-38-A** One, Clove Lakes Park, **Richmond**, 17 Sep

This report was submitted by an experienced observer, who saw the bird in flight. Although the description provided was suggestive of this species, there were too many missing details for the Committee to agree to accept the record.

**Yellow-bellied x Red-naped Sapsucker (*Sphyrapicus varius/nuchalis*)**

**2018-23-A** One, Esopus, **Ulster**, 26 Feb

This was an interesting report, which included photos of a *Sphyrapicus* woodpecker. The bird can be sexed as a male by its completely red throat with no white on the chin. It appears essentially like a Yellow-bellied Sapsucker (*S. varius*) but with noticeable red on the nape. In addition, the red throat barely bleeds into the black throat border at the corners. Although the latter might suggest the influence of *nuchalis*, Committee members felt that it was too minimal. Yellow-bellied does occasionally show red on the nape and since the red intruding into the black throat border was so minimal, the Committee decided that the case for a hybrid combination was not supported strongly enough.

**Gyr Falcon (*Falco rusticolus*)**

**2018-7-A** One, Jones Beach, **Nassau**, 1 Feb

**2018-9-A** One, Nanuet, **Rockland**, 19 Mar

The Jones Beach report was for a bird seen flying past the observer. Although the pointed wings and bulky size that were noted are suggestive of a Gyr Falcon,

Committee members were concerned about the missing details, such as the pattern of the underside of the wings, which should be paler on the flight feathers than on a Peregrine Falcon. The Rockland County report was also for a bird seen in flight. The underside was described as white with no barring and the back as uniform and light, white to whitish-gray. If this was a Gyrfalcon this would be the rarest and palest color morph that is seen in the state. Unfortunately, without knowing what the wing shape was, it is even possible that this was a leucistic Red-tailed Hawk, which had been seen in the area in recent years.

### **LeConte's Sparrow (*Ammospiza leconteii*)**

**2018-40-A** One, Albany Pine Bush Preserve, Albany, 5 Oct

This report involved a four minute observation of a sparrow showing buff on the side of the head, throat, and flanks, a clean white belly, and fine dark streaking along the flanks. The upperparts were reported to show dark centers with buff edges. Although this report received some support from Committee members, most felt that the close similarity between some LeConte's and Nelson's Sparrows, in addition to the missing details of the crown and nape, were enough for them not to accept a report of such a rare species.

### **Brewer's Blackbird (*Euphagus cyanocephalus*)**

**2018-11-A** Four, Vischer Ferry Nature & Historic Preserve, Saratoga, 8 Apr

This submission of three male and one female Brewer's Blackbirds along the edge of the Mohawk River seemed better for the similar Rusty Blackbird than Brewer's, to most Committee members. Although the iridescent green tint noted might suggest Brewer's, Rusty can also show this in some lights. Importantly, the female was noted to be all gray, which is better for Rusty, as female Brewer's are more brownish gray. A distinctive character to help separate females of the two species is the eye color, normally dark in Brewer's and light in Rusty. Unfortunately, the eye color was not noted.

### **MacGillivray's Warbler (*Geothlypis tolmiei*)**

**2018-27-A** One, Ulster Park, Ulster, 15 May

This was an intriguing report from a lone observer. The circumstances of the observation, as well as the habitat, were well described and the observer also included a colored drawing of the bird, placed on a photograph of the bush that the bird was perched in. However, it was not stated whether the sketch was from memory of what was observed or simply taken from a field guide. For such a remarkably rare species, reviewers felt that more was needed. The observer initially thought that she was hearing and seeing a Mourning Warbler and only considered MacGillivray's Warbler, of which she was previously unaware, after the sighting. The call that was heard seems to be what made her suspect that this was not a Mourning Warbler. It is assumed that she meant song, rather than call. However, the song and its difference from that of a Mourning Warbler were not described. Although some Committee members felt that the sighting could be correct, none felt that the evidence rose to the level of acceptance.

## 1984 Report Not Accepted

### **Eurasian Blackbird (*Turdus merula*)**

**1984-52-A** Six to ten, Goat Island, **Niagara**, 5 Aug

This was a very unusual report, submitted about 34 years after the sighting, from someone visiting Niagara Falls on his honeymoon. There was no photographic evidence, just a description of what was observed. The report implies that the identification of these six to ten males was made two years after the fact, when he observed his life Eurasian Blackbirds in England. Several aspects of this report would be extremely unusual for this species, especially the occurrence of six to ten individuals, the location, well away from the East coast, and the time of year. Even the possibility that these birds were escapes is highly improbable. The observer wrote that he was stunned to see American Robins that were all black. He also noted a yellow-orange bill and a light-colored eyering. While this description is clearly consistent with the species, documentation for such an extraordinary sighting would need to be much stronger to be accepted. A glance at eBird shows only two records in all of North America (eBird March 2021).

# **JANUARY WATERFOWL COUNT 2022**

**Bill Ostrander**

80 Westmont Ave., Elmira, NY 14905  
browncreeper9@gmail.com

More than 381 volunteers went into the field 15-23 January 2022 and conducted the New York State Ornithological Association's January Waterfowl Count. The volunteers logged 1086.66 party-hours and counted 384,400 waterfowl. The methodology of the count is described in detail by Swift (2007: January waterfowl counts, 2005-2007, and some observations on long-term trends; *The Kingbird* 57: 198-213).

## **WEATHER CONDITIONS**

Daily high temperatures in January leading up to the count period were mostly above freezing throughout the state, but most lows were below 25° F. Many lows in much of the state were single-digit or below zero. Both Saturdays in the count period were very cold with temperatures well below zero. Consequently, only large bodies of water and turbulent portions of streams were open. Several inches of snow fell 17-18 January and most of it persisted through the count period.

## **RESULTS**

In this summary, I will compare the 2022 numbers with the average annual numbers from the decade, 2001-2010. The total number of waterfowl counted this year, 384,400, was 694 (0.18%) more than the average for the 2001-2010 decade. Canada Geese, Brant, and Mute and Tundra Swans compensated for the lower numbers of dabbling ducks, diving ducks, and all other waterfowl.

Some species had higher counts than the 2001-2010 decade average: Ross's Goose, Canada Goose, Cackling Goose, Pink-footed Goose (the Count's first), Brant, Mute Swan, Tundra Swan, Wood Duck, Northern Shoveler, Redhead, Ring-necked Duck, Lesser Scaup, Long-tailed Duck, Hooded Merganser, Common Merganser, Red-breasted Merganser, and Ruddy Duck. The counts of 150 Wood Ducks, 44,589 Redheads, 5,506 Ring-necked Ducks and 3,459 Hooded Mergansers were the highest counts ever.

## **LONG-TERM TRENDS**

We have been watching for many years the long-term trend of increasing numbers of Tundra Swans wintering in New York State, the number peaking at 4,065 in 2016. In 2022, the count was 1,473, down from last year.

By comparing the averages for the periods 1973-2000, 2001-2010, and 2013-2022 possible long-term trends in New York State's winter waterfowl populations can be identified. Possible long-term increases can thus be seen for Snow Goose, Canada Goose, Brant, Trumpeter Swan, Tundra Swan, Wood Duck, Gadwall, Eurasian Wigeon, Northern Shoveler, Redhead, Ring-necked Duck, Common Eider, Harlequin Duck, Long-tailed Duck, Hooded Merganser, and Red-breasted Merganser. Long-term decreases may be happening to American Wigeon, American Black Duck, Northern Pintail, Green-winged Teal, scaup (sp.), White-winged Scoter, Common Merganser and Great Cormorant.

## FUTURE COUNTS

You can help with the 2023 count by contacting your Regional compiler. Compiler contact information, and also historical data from past counts, is available online at:

<http://nybirds.org/ProjWaterfowl.htm>

The January Waterfowl Count is conducted in a nine-day period that begins the Saturday before Dr. Martin Luther King, Jr. Day (the third Monday in January). The next two count periods will be: 14-22 Jan 2023 (target date Sunday, 15 Jan); and 13-21 Jan 2024 (target date Sunday, 14 Jan).

## ACKNOWLEDGMENTS

Thanks to everyone who participated in the 2022 January Waterfowl Count. The many dedicated field observers volunteered many hours in the field. Regional and local compilers and coordinators deserve special thanks for making sure that the state had good coverage and for compiling the data in a timely manner. The Regional compilers, this year, were:

Region	Compiler	Region	Compiler
1	Debbie Suggs	6	Jeff Bolsinger
2	Robert Spahn	7	Gary Lee
3	Bill Ostrander	8	Bryan Swift
4	Gail Kirch	9	Sean Camillieri
5	Bill Purcell	10	Clifford Hagen

# 1948 LONG ISLAND WATERFOWL SURVEY RESULTS

**Christopher K. McKeever**

Brooklyn, N.Y. Whitehall 4-2200, Ext. 56

**Editor's Note**—In 2022, I received a box of Christopher McKeever's field notes and bird records. Among these was a report that sheds light on a precursor of the January Waterfowl Count so familiar to NYSOA members and the broader New York State ornithological community. Publishing it here makes it available alongside the long-term waterfowl count data available in *The Kingbird*. Species names are as given in the original report, with clarifications provided in some cases in square brackets.

After a lapse of seven years, the Annual Long Island Waterfowl Survey has been started again. This Survey, the fifth one, was taken on December 11 and 12. The choice of dates was a fortunate one, as it was the weekend before the big snow storm. The weather prior to that time had been quite warm; in fact it was the warmest autumn on record and there was no killing frost recorded by the New York City Weather Bureau until November 30. The weather on the days of the Survey was fairly good and the coverage of the best areas was virtually complete. However, the Great South Bay east of Fire Island Inlet was covered from the north shore only and this was somewhat inadequate. In addition, due to a misunderstanding, the Orient Peninsula was not entirely covered, so that the figures given for the species usually most numerous, namely, scaup, black duck, scoter and the sea ducks are somewhat below the true figure.

Similar surveys at about the same time of year were made previously in the four consecutive years from 1938-1941 when the war forced a discontinuance. The waterfowl were on an up trend at that time which ended in the peak year of 1944. Thereafter their numbers decreased substantially. Unfortunately, no local survey data is available for 1942-1947.

Most of the pond ducks, other than black ducks and sporting bay ducks other than scaup, have definitely increased over their averages for the years 1938 through 1941 and it is believed that the Survey was most accurate with respect to these species. Of the above groups only the Pintail, Shoveller and Gadwall showed no increase in numbers, although neither did they show any substantial decrease.

In addition to the factor of incomplete coverage of Great South Bay and Orient Peninsula mentioned above, another important factor in the small counts of scoters and sea ducks is that the season on most ducks closed only four days prior to the Survey, and the shooting season for scoters was still open in Long Island Sound and Gardiners Bay. Consequently, many birds of the species mentioned above were resting way out beyond the reach of land based observers. Another factor in the case of black ducks is that a substantial number of them were probably still resting on the ocean or far out on the Sound in the daytime and

coming in to feed only at night. However, the black duck count is above that for the year 1941, when the survey was conducted toward the end of open season.

The following is a list, in the order of their abundance, of the species recorded in the Survey. The figures to the right of the numbers recorded on the Survey are various data from the 1938-1941 surveys which provides some basis for striking an average on the figures:

Rank	Species	Number	Data from 1938-41 counts			
			Average	High	Total	Low
1	Scaup	33,224	65,437			45,921
2	Black Duck	16,331	21,742			14,069
3	White Winged Scoter	10,733	21,882			11,657
4	Coot	3,714	201	440	804	
5	Red Br. Merganser	2,730	5,093			
6	Ruddy Duck	2,460	102	265	407	
7	Baldpate <sup>1</sup>	1,442	432		1,727	
8	Goldeneye	1,260	6,523			1,872
9	Old Squaw <sup>2</sup>	1,213	4,885			2,094
10	Mallard	961	858			
11	Canada Goose	832	357	515		
12	Green Winged Teal	644	141		565	
13	Surf Scoter	581	3,645			1,531
14	Canvasback	533	107		429	
15	Pintail	500	527			
16	Bufflehead	499	189	233		
17	Mute Swan	467	212	265		
18	Ring Necked Duck	377	79		314	
19	American Scoter <sup>3</sup>	343	769			345
20	Hooded Merganser	85	30	44		
21	Am. Merganser <sup>4</sup>	62	196			76
22	Brant	30	1,528	5,180		5
23	Redhead	27	13		54	
24	Shoveller	16	22			9
25	Gadwall	9	25			7
26	European Widgeon	7	4			
27	Wood Duck	2				
28	European Teal	1				
29	King Eider	1				
	Snow Goose	5,449				
	Blue Goose	5				
	Unidentified ducks					
	over 96% scoter	13,249				
		97,785				

[<sup>1</sup>American Wigeon; <sup>2</sup>Long-tailed Duck; <sup>3</sup>Black Scoter; <sup>4</sup>Common Merganser.]

One is immediately struck by the great decrease in the number of scaup. The two areas not adequately covered could hardly have brought the total up to that of the lowest year prior to this. It is possible that because of the relatively warm weather prior to the Survey, the scaup had not yet come down in their normal numbers. It is also possible that many of the birds which usually come into this area were among the 25,000 killed by oil on Lake St. Peter in the St. Lawrence River when a makeshift tanker went aground and spilled its cargo earlier this fall.

The number of black duck might have been increased to some extent if the Great South Bay had been adequately covered and a few more might have been added from the Orient region. Taking that into consideration, the present count would compare favorably with those of 1940 and 1941 which were taken during the hunting season, but does not stand up so well as compared with 1938 and 1939 when the survey was conducted after the hunting season. It is obvious that the black duck, which provides most of the local shooting, lagged behind the other sporting ducks in its increase. In 1940 nine other species of sporting ducks, excluding mallard and scaup, had a population equal to nearly 8% of that of the black duck. In 1941 they equaled nearly 12%. In 1948, without considering the ruddy duck, which increased tremendously, eight species of sporting ducks formed a population about equal to one-fifth of the black duck and, if we include the ruddy duck also over one-third.

It should be pointed out that the increases noted above are over pre-1941 figures and we have no comparable figures for 1944 which was the high point of waterfowl population in recent years.

The current Survey revealed two rather extraordinary conditions. The more interesting of these, from the standpoint of the bird watcher, is the fact that those observers on the south shore who chose the 12<sup>th</sup> to be out in the field witnessed the greatest flight of Snow Geese ever in this area. Those observers on the north shore on the same day did not see a single bird of this species. The Snow Geese and the few Blue Geese accompanying them obviously cannot be included in the Survey figures but, if they were, the Snow Geese would be in the remarkable position of being the fourth most abundant of our local waterfowl. Most of these birds were seen over the western half of the south shore. It is probable, although this has not as yet been checked with the Weather Bureau, that the steady southwest wind which was blowing all that day had pushed the birds off their usual direct course from a point slightly east of Quebec south to Delaware Bay. In addition, it seemed to have tired the birds, as nearly all of the observers noticed that they were quite ready to alight and were deterred from doing so only by their unfamiliarity with the area. Many of the flocks at the west end were seen to mill around quite aimlessly for awhile and finally to head straight across the ocean toward the Jersey coast.

The second extraordinary feature of this Survey was the unusually high counts of Ruddy Duck and Coot. At no time prior to this Survey did the Coot ever rank higher than the 13<sup>th</sup> most abundant species nor did the Ruddy Duck ever rank higher than the 14<sup>th</sup> most abundant species, yet this year the Coot was the 4<sup>th</sup> most

abundant species and the Ruddy Duck the 6<sup>th</sup>. Concurrently, more than four times as many Coot were recorded on this Survey as were seen on all the four previous surveys and more than six times the number of Ruddy Ducks recorded on the previous surveys were seen during this Survey.

Obviously something more than mere improvement of status due to a good breeding season is here involved and the explanation of the phenomenon can probably only be found by analyzing data from all over the country. It hardly seems possible that these two species had so extraordinarily good a breeding season and that their total numbers increased to that extent while all the other species merely had a fairly good breeding season. Both species appeared in numbers in the area prior to the first half of the open season and increased in numbers during the intermediate closing season. Apparently, they survived the hunting in this area quite well.

It is interesting to note the steady deterioration of the feeding grounds in this area favorable to the better sporting ducks by referring to a couple of comparable surveys taken, one this year and the other back in 1924. This deterioration is most marked at the present time in Moriches and Shinnecock Bays, since both of them now have permanent outlets to the ocean.

The same thing has happened, on a much smaller and more easily recorded scale, at Lake Montauk where a misguided real estate developer put a permanent outlet through to Gardiners Bay, thereby rapidly and permanently salting a nearly fresh water pond, the largest in Long Island.

On Lake Montauk, in December 4, 1924, there were observed the following species in the following numbers:

Canada Goose – 30, Brant – 20, Mallard – 11, Black Duck – 50, Green-winged teal – 1, Baldpate – 100, European Widgeon – 2, Pintail – 5, Canvasback – 1000, Redhead – 500, Scaup – 50, Ring-necked duck – 4, Goldeneye – 50, Bufflehead – 7, Old Squaw – 12, American Merganser – 12, Red-breasted Merganser – 100, Hooded Merganser – 9.  
18 species, nearly 2000 individuals, also another 2000 Coot.

On the same pond on this Survey, December 11, 1948, the following species were seen in the following numbers:

Scaup – 850, Old Squaw – 22, Scoter – 124.  
3 species, 996 individuals.

The above sets of figures speak for themselves and it is not to be wondered that the shooting in those areas is much poorer than it formerly was.

Thirty-two observers participated in this Survey, of whom nineteen were assigned territories. The other thirteen cooperated with one or the other of the above observers but, unfortunately, most of the latter were on the western end of the Island. Below is set forth a list of the observers responsible for territories, followed by those who assisted them:

**Assigned Observers**—Richard Adelson, New York City; Robert Arbib, Jr., Freeport, L.I.; Daniel Berolzheimer, Massapequa, L.I.; Herman Bohn, Flushing, L.I.; John L. Bull, Jr., Far Rockaway, L.I.; John Elliott, Seaford, L.I.; John W. Flavin, Jr., Floral Park, L.I.; John L. and Dr. Wm. T. Helmuth III, East Hampton, L.I.; John Mayer, Ozone Park L.I.; C. K. McKeever, Brooklyn, N.Y.; Dr. Robert C. Murphy, American Museum of Natural History, New York City; Theodore Pettit, Inwood, L.I.; Gilbert Raynor, Manorville, L.I.; George Rose, Mineola, L.I.; Peter Scott, East Hampton, L.I.; Walter Sedwitz, New York City; LeRoy Wilcox, Speonk, L.I.; Rawson Wood, Flower Hill, L.I.

**Cooperating Observers**—Irwin Alperin, Brooklyn, N.Y.; Gilbert Banner, Forest Hills, L.I.; Ben Berliner, Hewlett, L.I.; Harry Darrow, Mt. Vernon, N.Y.; Herman Goebel and Dr. Malcolm Jacobson of Brooklyn, N.Y.; George Komorowski and David Roche of The Bronx, N.Y.; Don Ross, Port Washington, L.I.; George D. and Thomas K. Scott, East Hampton, L.I.; David Slade and Jack Wells of Kew Gardens, L.I.

=====

## NOTES AND OBSERVATIONS

### **Crossbilling in Northern New York, 28-30 January 2022: A Banner Season for Crossbills**

**Matt**—We covered Sabattis Bog, Long Lake, Newcomb, Minerva, and then drove down to Piseco and Lake Pleasant.

In the 20+ years I've been doing crossbill work in New York State, 2022 was the best overall crossbill year I've seen for both species at the same time. For White-winged Crossbills alone, the 2001-02 breeding event was just unbelievable. They were singing everywhere even if there were only 5-10 spruces in a boggy spot—but you could barely find a Red Crossbill during that event. 2022 was the second best year for white-wings I've seen.

We've had a number of good Red Crossbill years since then, like in 2003, 2005, 2008, 2012, 2017, but what we witnessed during this weekend was pretty special for any crossbill/finch fan. Lots of flight songs, pairing, singing and chasing were observed for both crossbill species. The Red Crossbills were pretty ubiquitous, while the White-winged Crossbills were in the best boreal forest pockets—but in smaller numbers elsewhere as well. Reds outnumbered the white-wings in most locations except in the best boreal pockets.

What's also interesting about this Red Crossbill event is it was basically almost entirely made up of only our northeastern call type, Type 10. Most good Red Crossbill years we have a mix of Type 3 and some Type 1 and 2 as well. I finally observed a Type 1 in the southern Adirondacks south of Hoffmeister as I was leaving the park. All told, we had close to 200 Red Crossbills and 110 White-winged Crossbills. We had almost 100 Pine Siskins as well.

There are Type 1 and some Type 10 in the southern part of the state too, and I'm interested to see if Type 10 has expanded its breeding range southward into

southern NY and PA where Type 1 is the more common type. There are some Type 10 in PA that sound like they could be breeding.

While warming weather and a late April snowstorm prevented these numbers from turning into a full-scale breeding event, birders participating in the New York Breeding Bird Atlas ultimately confirmed breeding for White-winged Crossbills at Sabattis Bog, at several sites in Newcomb, and Raquette Lake, while probable breeding behavior was recorded in two dozen additional atlas blocks. Atlassers have confirmed Red Crossbills in more than 40 atlas blocks so far across the Adirondacks and central New York, with probable breeding in dozens more.

**Ryan**—There were never not finches during our trip. Every time we opened the car door we heard a Purple Finch or one of the crossbills flying over. Effort consisted mostly of driving along the road and stopping to listen, getting out of the car to record flocks that seemed especially large or to photograph birds gritting on the road.

Each moment topped the last. Many of the highlights were on the first day. On Blue Ridge Road, a Golden Eagle circled us for several minutes, and many expletives were uttered. Immediately following, we caught up with a pure flock of Boreal Chickadees, all vocalizing, one bird sitting in the open and getting chased by a Black-capped while White-winged Crossbills chipped overhead. An hour later on Tahawus Road, we experienced boreal bird bacchanalia; crossbills doing song flights and feeding, siskins singing, and goldfinches flying all around, all while a goshawk called and then circled above us for a minute or more.

Most of the crossbills in the Adirondacks were rather skittish, but in Piseco on the southern edge of the park, we seemed to have found a communal hangout spot for the birds. Red Crossbills were singing, gritting, courting, and eating. Flocks flew in and out of the spot, making it hard to keep count. A crossbill almost landed on my head. Two of my photos are on page 161.

We also spent lots of time documenting the cone crop. Red, white, and black spruce all appeared to be good to very good, as did hemlock. Pines had few cones on them, and we noted some, but not a lot of catkins on the birches.

It was a great time, we encountered lots of great people and are happy that many got to experience the winter 2022 finch bounty.

**Weather**—Friday 1/28: Cloudy, wind NW 5mph, 20 degrees dropping to 15 in the afternoon. Saturday 1/29: Cloudy, clearing later in the day. 1 degree in the AM, rising to 7 degrees and back down to 1 in the afternoon. Wind N 10mph, turning NW later in the day. Sunday 1/30: Clear all day, wind NW 5mph. -16 degrees at daybreak, warming to the 10s as we drove south.

**An Apparent European Herring Gull  
(*Larus argentatus argentatus*)  
at Old Field Point, Suffolk County, Long Island**

Old Field Point, on the shore of Long Island Sound in northwestern Suffolk County, NY, was a prime place to view wintering gulls in early 2022. A returning Black-headed, multiple Bonaparte's, a bright white Glaucous, multiple Iceland, and two Lesser Black-backed Gulls mingled with the common three: Ring-billed, American Herring, and Great Black-backed Gulls. Of the hundreds of gulls present, a few Great Black-backs and American Herring Gulls displayed varying amounts of yellow on their legs, but on 22 Feb at 11:43 a.m. in good light, one gull stood out from the rest to PD and other observers (including Douglas Futuyma, Barbara LaGois, and Peter Osswald).

Its bright yellow legs and slightly darker mantle tone were very unlike the locally abundant North American subspecies *L. a. smithsonianus*, and also the several variants showing some yellow tones on the legs. PD and Barbara shared photos with SSM and Patricia Lindsay, who studied the bird on 23 and 27 Feb and contributed to online discussions regarding its identity. The bird was seen and photographed by many and was last seen by PD on 30 Mar.

Among the identification candidates proposed in early discussions were Yellow-legged Gull (*L. michahellis*) and hybrids between Herring Gull and Lesser Black-backed Gull (*L. fuscus graellsii/intermedius*). SSM was struck by the bird's strong detailed resemblance to Herring Gull in multiple respects and suggested that variant Herring Gulls should also be considered. It is not unusual for *smithsonianus* to show yellow leg color in late winter and spring, as noted by PD at Old Field Point this winter, and as extensively documented by SSM (unpubl. data). Yellow-legged individuals occur even more frequently among nominate *L. a. argentatus* breeding near the Baltic Sea and in northernmost Europe (Malling Olsen and Larsson 2003), and, as these populations also show darker mantles than other Herring Gulls, this possibility was considered as well.

**Description**—The overall size and structure were very much like Herring Gull, with a heavy bill, broad wings, angular nape and fierce countenance; the mantle tone was subtly but quite clearly slightly darker than *smithsonianus* or Ring-billed Gull (*L. delawarensis*); field impressions of this trait were noticeably variable according to lighting and angle, as were photos. The legs and feet were bright yellow, lacking drab pinkish or grayish tones. The bill was clear, bright yellow lacking dusky markings, and the red gonys spot was slightly longer than in most *smithsonianus*, though not as extensive as in breeding-condition *L. fuscus graellsii/intermedius*. The irides were clear yellow, not whitish; the orbital ring was described by several observers as red, though this was not discerned by SSM; the nape was coarsely streaked, whereas the crown and face showed finer streaking, forming a squarish panel around the eye and onto the cheek. The wingtips showed lots of white on pp 9-10 and restricted black on pp 6-8, compared

to most local *smithsonianus* (although probably matched by some). Notably, the apical spots on the primaries were definitely larger than in all *smithsonianus* present for direct comparison, a contrast also evident in large series of photos of Herring Gulls from Long Island. See photos, pages 164-165.

**Identification**—The large white apical spots and relatively restricted black on the primaries are obvious and distinctive features strongly counter-indicative of Yellow-legged Gull, a taxon anticipated as a vagrant but as yet still unconfirmed in NYS. Although some local *smithsonianus* regularly show yellow legs in late winter and early spring, the color is almost never as clear and pure yellow as in this case. Mantle tone is less variable among local *smithsonianus*, and otherwise typical examples never or almost never appear as dark as this bird. Additional features pointing away from *smithsonianus* include the relatively large red gonys spot, the red orbital ring, and, to a much lesser extent, the wingtip pattern, which shows less black than is present in most populations of *smithsonianus* (northeasternmost populations have least black, resembling *argentatus*: Malling Olsen and Larsson 2003).

Many observers and commentators noted that the mantle and soft parts features counter-indicative of *smithsonianus* are shown by Lesser Black-backed Gull, and some concluded that hybrid *smithsonianus*  $\times$  *gracillii/intermedius* was the most likely interpretation. But it is important to note that only two of these features are actually intermediate: mantle tone and the size of the gonys spot. Conversely, the red orbital ring color and yellow leg color are like *gracillii/intermedius* and not at all suggestive of *smithsonianus*. The legs of individuals identified as hybrids in eastern North America almost always show drab pinkish/yellowish tones intermediate between non-breeding individuals of the putative parental species (pers. obs.). Similarly, the Old Field Point bird's yellow iris tone, large overall size, and broad-winged and strong-billed structure are like Herring Gull, not intermediate toward the smaller, slighter Lesser Black-backed Gull. Most importantly, the primary pattern, far from being intermediate between the two proposed parents, is actually beyond many *smithsonianus* in the direction away from Lesser Black-backed Gull. In contrast, known hybrids between Herring and Lesser Black-backed Gulls have shown intermediate wingtip patterns, including black subterminal bars on primary 5 (absent on the Old Field Point bird), and sometimes even on primary 4 (Malling Olsen and Larsson 2003).

Whereas the appearance of the Old Field Point bird poses multiple obstacles to each of the interpretations considered thus far, it is consistent in every respect with northern European populations of *L. a. argentatus*. Compared to other Herring Gulls, these have darker mantles, large apical spots and restricted black in the primaries, and often show red orbital rings and extensive red on the gonys (Malling Olsen and Larsson 2003). Interestingly, the very features that render the Old Field Point bird most unlike *smithsonianus*—darker mantle, bright yellow legs and bill, red orbital ring, and extensive red on the gonys—co-occur together

within some populations of *argentatus*, for instance near the Baltic Sea and in northernmost Fennoscandia (Malling Olsen and Larsson 2003; Gull Research Organization 2013).

**Conclusions**—Although acknowledging the points above in a general way, some commentators preferred the hybrid Herring x Lesser Black-backed hypothesis, based on three points: that a northern European origin is improbable for a gull on Long Island; that hybrids between Herring and Lesser Black-backed Gulls are frequent in eastern North America, based on the occurrence of birds appearing intermediate between the two species; and that the present bird's many non-intermediate features are plausible for a hybrid, in view of the sometimes large and unpredictable variability of hybrids in other contexts. We question all three of these points. First, migration and vagrancy from northern Europe to the coastal northeastern United States is well documented among multiple species of gulls and waterfowl, including, ironically, Lesser Black-backed Gull itself; the paucity of records of European Herring Gulls here is surely at least partly a function of the extreme similarity of many adult *L. a. argentatus*, and almost all adult *L. a. argenteus*, to local *smithsonianus* (and also the similarity of immature European Herring Gulls to Lesser Black-backed and Yellow-legged Gulls). Second, the perception that hybrids between Herring and Lesser Black-backed Gulls are frequent in eastern North America is based on records of intermediate-looking birds whose actual identities are almost always unknown. Ironically, the very few documented examples of hybridization have involved multiple combinations of taxa of both species: *graellsii* x *smithsonianus* at Appledore Island, Maine (Ellis 2014); *graellsii* x *argenteus* in Iceland, Britain, and France; intergrade *graellsii/intermedius* x intergrade *argenteus/argentatus* in Belgium and the Netherlands; and *intermedius* x *argentatus* in Denmark (Malling Olsen and Larsson 2003). The intermediate-looking birds presumed as likely hybrids in North America might easily include birds of disparate ancestries, not only from these pairings, but potentially also hybrids of Lesser Black-backed with Thayer's or Kumlien's Iceland Gulls. And some might actually be vagrant Yellow-legged Gulls, or, as we suspect in this case, vagrant *argentatus* Herring Gulls. Finally, arguing that intermediate-looking birds must be hybrids, and that non-intermediate-looking birds are also probably hybrids, does not advance the problem beyond the truism, "it is never possible to rule out a hybrid with certainty."

The Old Field Point bird originated somewhere, in a population of *Larus* gulls. Individuals sharing all of its features occur regularly in northern European populations of *L. a. argentatus*, and these ought to be regarded as the most likely origin for this individual.

## HIGHLIGHTS OF THE SEASON—WINTER 2021-22

**Michael F. Cooper**

mikec02@optonline.net

Perhaps more than any other season, weather is really a driver of birds present and birds reported through a winter season. Mild temperatures can allow species to linger that normally flee in advance of the turning calendar pages, while unseasonable cold can drive birds into areas where they can be viewed more easily. High or low water levels or deep snow affects where birds can feed—waterfowl far out of sight on large lakes or sparrows along roadsides picking through exposed seed heads or searching for grit.

Last winter had all of this. Despite New York's sprawling latitudes and diverse habitats, the weather during the winter of 2021-2022 was remarkably uniform. December was four to seven degrees above normal in every Region, January two to eight degrees below average across the board, and was followed by a more or less average February nearly everywhere. Mild December temperatures lured many half-hardy species to delay their southward movements and encouraged waterfowl to remain on open water. Snowstorms in mid-January and February drove up sightings of Snow Buntings and Lapland Longspurs and pushed birds in to feeders and out to roadsides.

Waterfowl remained into December in numbers and variety in most Regions, with lingering ducks mentioned especially in northern and western Regions even into mid-January. Highlights included good numbers of Wood Ducks in Region 1, Green-winged Teal in Regions 3 and 10, and American Wigeon in Region 5. Among the more unusual species, Harlequin Ducks seemed to be especially widespread, with six Regions reporting them, including two different birds each

in Region 6 and 7, where rare. Four Regions reported Tufted Duck, and scoters were pretty widely scattered around. However, in Region 10, where observers have been spoiled in recent years with flocks of Common Eider in the four digits, the high count this season was just 78 birds. Scoter numbers were far below normal there as well.

While the news is filled with stories of declining populations of birds, geese have generally been exempted from that fate. Geese again were well-represented here, both in numbers and in variety. Among the species generally considered rare here, Ross's was recorded from six Regions, Greater White-fronted from seven, and Pink-footed from two, including from five different locations in Region 10. Barnacle Goose seems to have escaped the scrutiny of the annual wild goose chase.

For those down-staters not paying close attention, it is a bit surprising that there are parts of the state where Mute Swans are seldom encountered. Region 7 had its first since 2008, this one near Essex Ferry. Trumpeter Swans were recorded from five Regions, with a max of 42 at Wilson Hill WMA in Region 6. I find it to be an interesting dichotomy that while the expansion of Mute Swan—originating from escapes over 100 years ago—is lamented, the expansion of Trumpeter Swans—originating from escapes 30 years ago—is welcomed. Neither are native breeders in New York.

Among the “duckaloids”, an impressive count of 108 Horned Grebes at Floyd Bennett Field in Region 10 was the exception—most other reports were of disappointingly low numbers. Red-necked Grebes were well represented at the opposite end of the state, in Region 2 at Hamlin Beach SP, with a high count of 826. An Eared Grebe there on 26 December and another on Seneca Lake in Region 3 on 13 February were good finds, and the only ones reported state-wide. Great Cormorants were nice rarities at Buffalo in Region 1 and on the Rochester CBC in Region 2. They also made a very impressive showing in Region 9, with a high count of 15 at Fleischmann's Pier in Westchester County. A Pacific Loon was photographed in Oakdale, Suffolk County in Region 10.

Although the Razorbill flight in Region 10 was generally unimpressive, they were recorded from four other Regions around the state. These were mostly birds lingering from the widespread fall incursion, but impressive sights, nonetheless. Other than that, only Region 10 recorded alcids, with Dovekie and Thick-billed Murre being easier to find than usual.

Impressive counts of Bonaparte's Gulls in Region 1 included several tallies of over 10,000 birds. Associating with these huge flocks were double digit numbers of Little Gulls, with a max of 19 seen on the Niagara River from the Ontario side. Region 1 hosted a rare-in-winter Laughing Gull, while a Franklin's in Region 9 was far from its normal winter range. Iceland, Glaucous, and Lesser Black-backed Gulls were widespread and well-represented. Getting down to the “really good gulls”, Slaty-backed was, amazingly, recorded from three Regions—including a “celebrity” bird that showed itself to many at the reservoir in Central Park, Region 10. The others were in Region 5 and, less surprisingly, in Region 1

at Niagara Falls. A bird found on the north shore of Long Island by Patrice Domeischel seemed to check all the boxes for a European Herring Gull. The bird was an adult, well seen and photographed, and was present for weeks.

Shorebird reports were probably about normal overall, with mild December conditions encouraging Killdeer to remain into the winter period in at least eight Regions. Not surprisingly, Region 10 had a nice variety of shorebird species, including Least and Western Sandpipers, Piping Plover, and Short-billed Dowitcher. Easily the highlight, though, was the Northern Lapwing found by Mike Vedder on 18 December. Seen by many that day, it could not be relocated the following day for inclusion on the Captree CBC. Elsewhere in the state, Regions 2 and 3 reported Red Phalarope, and a Spotted Sandpiper was found at Dorchester Park in Region 4.

Sandhill Cranes continue to establish themselves as part of the New York avifauna scene, with reports from five Regions. Regions 2 and 3 recorded high counts of 300-400 birds. Checking on other birds with long legs, Great Blue Herons showed their normally widespread distribution, while Regions 1 and 2 recorded late lingering Great Egrets. Tricolored and Green Herons in Region 10 were also good finds.

Somewhat surprisingly, no hummingbirds were reported from any locations this winter. Taking a serious jump up in size, nine Regions reported Golden Eagles. Surely this is a sign of a real increase in this species' population. Not long ago Golden Eagle could only be found at a few very specific sites. One at Oceanside in Region 10 was most surprising but even there the species is becoming almost annual in occurrence.

Black Vulture now occurs routinely in small numbers throughout the state in the winter months. They were reported from eight Regions this winter. There was no discernable flight of Northern Goshawk, but they were recorded from seven Regions. Northern Harrier presented a mixed bag, with high counts noted in several Regions while in Region 6 Jeff Bolsinger considered them to be "especially down, with maximum counts of no more than three on Point Peninsula and Cape Vincent, where as many as 22 were seen daily last winter." A similar situation was noted for Rough-legged Hawk, with widespread reports and good counts in several areas, but again lower than expected tallies in Region 6. Bob Spahn made the following comment about using eBird reports of Rough-legged as a guide to abundance. "This year, a few individuals hung out in the general Braddock Bay area much of the season generating many reports for the few birds." I'd guess that this statement could be extrapolated to any open-ground, charismatic raptor. A Broad-winged Hawk at Prospect Park in Brooklyn was a rare find for any location in North America north of southern Florida.

Short-eared Owl is another species that could be included in the above eBird comment, but there did actually seem to be decent numbers recorded, with single site counts peaking at 10 birds at Nations Road in Region 2. David Wheeler in Region 5 talks about the possibility of an industrial park impacting a Short-eared Owl location there. The planned Micron plant has received positive national news

coverage, but hopefully the negative effects it would have on the local habitat can be mitigated? Snowy Owls put on a bit of an incursion, with reports from every Region. Again, Regional editors were diligent about trying to reconcile numbers of eBird reports to numbers of individuals present. Lance Verderame in Region 4 describes a series of maladies endured by one Snowy, while another in Newburgh in Region 9 apparently worked out a method to conserve migration energy by riding the ferry. A Long-eared Owl in Region 7 represented the first winter record in over 20 years.

While there was no widespread irruption of winter finches, the Adirondacks in Region 7 experienced a bonanza of both Red and White-winged Crossbills and Pine Siskins, all in notable numbers, and with courtship behavior noted. See the Notes and Observations piece above, where Matt Young describes 2022 as “the best overall crossbill year” in his 20+ years of studying them in the state, and “the second best year for white-wings” that he’s seen....”. Regions 1 and 4 also got a taste of the Red Crossbill irruption, with some indication of courtship behavior in both. Otherwise, the expected species were scattered around in low numbers. Bohemian Waxwings and Pine Grosbeaks were each reported from only two Regions.

As mentioned up top, there were lots of “half-hardy” species lingering at least into December. “Traditional” half-hardies include species like Hermit Thrush, Ruby-crowned Kinglet, and Gray Catbird. All of these and many more were widespread and reported in good numbers. Another, Yellow-bellied Sapsucker, was reported from eight Regions and was specifically called out as occurring in high numbers in several of those. American Pipit—not normally grouped as a half hardy—was also widespread and present in good numbers. Multiples were found in Regions 1 and 2, where considered rare, and in Region 8 its occurrence through all three months was termed “unprecedented”. A flock in Region 10 of 100 birds was exceptional.

Beyond the normal half-hardies, there were many records of real surprises among the late lingering species. A few of the highlights were a Summer Tanager at a feeder in Region 1, a Black-throated Green Warbler in Region 6, Baltimore Oriole and Rose-breasted Grosbeaks in Region 7, Nashville and Cape May Warblers in Region 8, Yellow and Tennessee Warblers and an Indigo Bunting in Region 9, and Veery, Wood Thrush and 15 species of warblers in Region 10.

And then there are those species whose normal ranges do not include New York State—perhaps the spiciest of the rarities. Among those not already mentioned, highlights include the Region 2 Painted Bunting, in this case a male that spent a few days at a feeder and was enjoyed by many. Region 9 hosted several out-of-range rarities, including Ash-throated Flycatcher, Mountain Bluebird, Black-headed Grosbeak, Western Tanager, and two LeConte’s Sparrows. In Region 10, highlights included two Western Tanagers in Manhattan, a Gray Kingbird on Staten Island, and Ash-throated Flycatcher and Western Kingbirds. A Henslow’s Sparrow is a great find anytime in Region 10, and one in Brooklyn was good winter record.

In a season with so many rarities, selecting one as Bird of the Season is not an easy or clear-cut decision. But, for its status as a continent-wide rarity and the fact that it cooperated, albeit for only one day, I'd have to go with the Northern Lapwing in Region 10. I can only imagine the shock of finding that bird at a routine birding site and the relief of hearing that it was later relocated a short distance away!

So that wraps up an exciting winter season. I look forward to seeing what you all turn up next time around.

Much of the data in the Regional reports is sourced from eBird: eBird Basic Dataset. Version: EBD\_relFeb-2022. Cornell Lab of Ornithology, Ithaca, New York. Feb 2022.

## **REGION 1 – NIAGARA FRONTIER**

### **Mike Morgante**

morgm@roadrunner.com

### **Joel Strong**

1907 Hess Rd, Appleton, NY 14008  
joelstrong78@yahoo.com

The winter season started off unseasonably warm in December, followed by above average cold and snow in January, and finishing off in February with a thaw that melted most of the accumulated snowpack. December 2021 was exceptionally mild, ranking as the second warmest on record. The mean temperature at the Buffalo weather station was 38.2° F, a staggering 6.8° above normal. Precipitation was low, with 2.46" of precipitation, 1.29" below average. Snowfall was exceptionally low with a total of 5.7" falling, 19.6" below normal. January's weather made up for the mild December, consisting of cold, snowy weather that tested the limits of residents' snow blowers and shoveling skills. The mean temperature was 21.9°, 3.6° below average. Precipitation was 3.59", 0.24" above average and a total snowfall of 52.1" was an impressive 25.4" above normal. Snowy weather continued in the first half of February, but the second half brought the first signs of spring and thawing out from winter's grip. The average temperature was 28.5°, 2.1° above normal. Precipitation was 4.57", 2.08" above average and snowfall totaled 23.1", 5.0" above normal. The rains, combined with melting snow, led to flooded conditions across much of the Region.

The warm December was likely responsible for some waterfowl lingering longer and a few more overwintering than usual. A few Cackling Geese were found in the Canada Goose flocks around Buffalo Harbor and the Niagara River

beyond December, while it was likely the most reports of Wood Duck beyond December ever. Diving ducks were found in decent numbers along the Niagara River, and as ice crept in on Lake Erie during the cold January and first half of February, reports of tens of thousands ducks were made at Buffalo Harbor. A maximum count of 13 Greater White-fronted Geese was made among a few reports in December, but there were no reports of February arrivals like in most recent years. Trumpeter Swans were reported from Iroquois NWR into late December, while Tim Lenz had (and heard) a group of five on Lake Ontario at Fort Niagara SP on 21 February, where sightings of this species have been rare. Hundreds of Tundra Swans wintered on the Niagara River, with some on Chautauqua Lake as well. A single group of 103 Ring-necked Ducks was a good number at Buckhorn Island SP during the Winter Waterfowl Count. A female **Tufted Duck** found by Josh Ketry at Buffalo Harbor on 26 December was sighted there in the following two days but not beyond. There were a few reports of King Eider from Fort Niagara SP, while one male Harlequin Duck was seen often above Niagara Falls through 24 December but no reports were made beyond that from this regular wintering location. Northward migrant dabblers, geese, and Tundra Swans started to return in February with the first likely migrants in the second and third weeks.

The **Razorbill** excitement continued from the fall season with up to four at a time (!) sighted on Lake Ontario off Fort Niagara SP through December until late January.

A few double digit counts of Sandhill Cranes were made in the vicinity of Iroquois NWR in December, while northbound migrants in the Region were first noted on 21 February. Shorebirds are sparse during the winter season, with just four species reported. Killdeer and Wilson's Snipe were reported in December, while the first Killdeer and American Woodcock arrivals were noted in February. The shorebird highlight was clearly a Purple Sandpiper observed from Niagara Falls SP on 20 and 22 January.

Gull enthusiasts were happy with the numbers of both large and small gulls on the Niagara River this winter, which both seemed to peak in late December and early January. There were several Bonaparte's Gull counts of greater than 10,000 from the mouth of the Niagara River as they made their afternoon exodus to Lake Ontario. Some double digit counts including a maximum of 19 Little Gulls were made during these "fly-past" sessions as well. A few Black-legged Kittiwake reports were made along the Niagara River earlier in the winter, while one photographed by Gale VerHague at Dunkirk Harbor on 11-12 February was more surprising based on date and location. Juvenile Sabine's Gull reports included one at Niagara Falls on 1 December and presumably another found on 14 December at Unity Island by Sakura Paterniti that many observed in the vicinity through 22 December. A Laughing Gull found by Harper Cisely and Don Dixon at Erie Basin Marina in Buffalo in late December stayed for more than ten days at that location. An adult **Slaty-backed Gull** was found at Niagara Falls SP by Josh Ketry on 5 January and again on 16 January independently by Joel Strong

and Rob Sielaff. This Asian species may be losing its “Mega”-rare status locally with sightings in four of the last six winter seasons at Niagara Falls, while it remains a difficult ID challenge, and each winter some birders are too quick to make the call on similar looking ‘odd’ large gulls.

On 2 February at Erie Basin Marina in Buffalo, Shelley Seidman photographed a large cormorant that she felt was unusual. Sure enough, it was an immature **Great Cormorant**, only the third for the Region. Three days later it was refound in the same location and then down river in Tonawanda. It became a regular in Tonawanda, often among a wintering group of Double-crested Cormorants, near Aqua Lane Park, Motor Island WMA, and as viewed from Beaver Island SP. The Great Cormorant was present through the rest of the winter and into early April.

Great Blue Heron and Black-crowned Night-Heron lingered into the end of December and a late Great Egret was seen throughout most of January at or near Beaver Island SP.

Black Vultures were seen at the usual Lewiston location throughout the winter with a high count of eight for the season. Turkey Vultures were more widespread compared to other winter seasons with a high count of 43 on 1 December at the Lewiston roost and sightings within several different counties. Allegany County produced the only winter Golden Eagle sightings with one on 26 December by Matt Nusstein and Claudia Rosen and another on 12 February by Brad Carlson, possibly representing the same bird. Northern Harriers made a nice showing at John White WMA with a count of eight on 12 and 17 December. Bald Eagles were reported throughout the winter season with a high count of seven from the Niagara River in Tonawanda on 15 February. Rough-legged Hawks were also reported throughout the season, with an impressive 22 reports in January. Up to three were regularly seen hunting a field in Porter this winter.

There were no reports of Northern Saw-whet Owls and only one report of Long-eared Owl during the winter season. However, the Long-eared Owl sighting included an impressive tally of five individuals found by Willie D’Anna and Betsy Potter in Yates. Snowy and Short-eared Owl reports were more prevalent. Buffalo Harbor produced a high count of four Snowy Owls with numerous other reports there throughout December and January. Short-eared Owls were reported throughout the winter season from several, mostly regular locations as either singles or pairs of birds.

Red-headed Woodpeckers were sparse, with winter reports from only two locations. Yellow-bellied Sapsuckers, on the other hand, continue to show a trend of increased winter frequency, with several reports during the season, including 22 reports in January alone.

Eastern Phoebe is another species that we are seeing leaving later in the winter and arriving early in the spring. This winter season had two December reports and the last bird reported on 16 January from Beaver Island SP, which represents only the third January record of this species for the Region. Several

Northern Shrikes were seen throughout the Region with 14 December, eight January, and five February reports.

Fish Crows have become a more regular sighting in Buffalo over the last few years and a maximum count of 16 was tallied there on 22 December as well as several smaller counts in January and February elsewhere in Buffalo. Josh Ketry also reported one mixed in a flock of 140 American Crows in Olean on 6 February, representing a sighting well away from their better-known Buffalo and Niagara Falls locations.

Several Horned Lark flocks numbering in the 100s were reported throughout the Region with a maximum count of 275 in Yates on 21 January. Lapland Longspur reports were sparse, most of which came from the Lake Ontario plain, with a maximum count of seven in Yates on 22 January. Snow Bunting flocks were smaller compared to last winter with a maximum count of 325 in Alexander on 15 February.

Flocks of up to 100 Cedar Waxwings remained towards the end of December, but unfortunately no Bohemian Waxwings were reported. A handful of Gray Catbirds and Hermit Thrushes, both “half hardy” species, were reported throughout the winter season. Even more prevalent were Yellow-rumped Warblers with up to 14 tallied on 8 January at Buckhorn Island SP, an annual wintering location. An American Pipit was reported in late January to early February at Buffalo Harbor, representing a rare winter sighting, but one that is slowly becoming more frequent in recent years.

In the winter finch arena there were no Evening or Pine Grosbeak reports, but the Region did enjoy sightings of the other sought after finches. A smattering of small flocks of Common Redpolls and Pine Siskins were reported throughout the Region with maxima of 35 and 12, respectively. Red Crossbill reports came from the Southern Tier conifer plantations in Cattaraugus and Chautauqua Counties, including some singing and early breeding behavior. The only White-winged Crossbill sighting was from Krull CP on 9 December by Eric Schill.

Several sparrow species had good winter showings compared to years past. Among them, were reports of seven Field Sparrows, four Fox Sparrows, and numerous small flocks of White-crowned Sparrows. Two January reports of Savannah Sparrow suggest overwintering individuals, an increasingly common occurrence. There were also numerous Eastern Towhee reports throughout the winter season, mostly from southern counties within the Region.

Blackbirds were well-represented in the winter season with some lingering throughout the season and the first migrants appearing towards mid- to late February. Five Eastern Meadowlarks on 1 December and three on 8 and 22 January was a good winter showing. Red-winged Blackbirds and a few Common Grackles were reported throughout the winter, while the only reports of Rusty Blackbirds came from spring arrivals at the end of February.

Homeowners Chris and John Hoisington hosted a rare **Summer Tanager** at their feeders in Springville from 1 December to 7 January. This record represents the first of any tanager species past mid-November for the Region.

## REGION 2—GENESEE

**Robert Spahn**

716 High Tower Way, Webster, NY 14580

rspahn@prodigy.net

The winter of 2021-22 provides a good illustration of the various influences on the birding scene that combine to make any season both similar to most of the past but also unique. Weather plays a prominent role, with timing of events critical.

Most longer-term trends remained in play. Some of the recent events simply died down or ended for a season. This was overall a pretty bland season.

On the weather scene, we started with a warm, quiet December, with little snow. Temperatures averaged 36.7° F, 4.7° above normal, for the fifth warmest December on record. Only seven days averaged below normal. Record highs were set on the 11<sup>th</sup> and 16<sup>th</sup>. Precipitation at 2.02" was 0.65" below normal, and snowfall of 10.1" was 12.2" below normal. Lake effect brought some short-lived snow cover on the 8<sup>th</sup> and 16<sup>th</sup>. Passing fronts brought gusty winds on a handful of dates, with 75 mph winds on the 16<sup>th</sup> causing some damage in western parts of the Region. Messy weather hit the southwest part of the Region on the 18<sup>th</sup> and following, once again negatively impacting the Letchworth-Silver Lake CBC. The other two local CBCs saw decent, relatively warm conditions. From this warm start to the season, January slid from a high near 50° on 1 January to chill and snow. Temperatures averaged 19.5°, 6.7° below normal. It was the coldest January since 2015. Precipitation totaled 2.50", 0.05" below normal. There was some snowfall on 28 days, but the only significant event was 10.4" on the 17<sup>th</sup>. Total snowfall was 34.4", 7.5" above normal. The Lake Ontario water temperature dropped from 42° to 34°, and some shore ice developed by month's end. February brought a slow rise in temperatures. There was light snowfall on 19 days, with heavy snows of 9.2" from 2-3 February and 5" on 25 February. Snow cover started at > one foot and dropped slowly. Mid-month saw a record-for-the-date 0.95" of rain on the 17<sup>th</sup>, with some flooding then and again late in the month with more warmth and rainfall. There was limited shoreline ice on Lake Ontario, but bays, ponds, and inland lakes remained frozen all month. Temperatures averaged 26.1°, 1.3° below normal. Precipitation totaled 3.45", 1.32" above normal, and snowfall at 26.3" was 3.2" above normal.

Looking to the general birding picture, there was nothing really surprising. The warm December was certainly a part of the month's large species total, 142 vs. a 10-year average of 132.8. But the cold and snowy January and a bit below average February both also remained at above average species counts at 136 (127.7) and 124 (121.6), respectively. The eBird downloads were likely within normal fluctuations. December's approximately 27,407 was up about 10% from 2021, while January at 33,365 was down about 10% and February at 28,991 down about 20%. The February dip may have been partially caused by the rainy weather around the great Backyard Bird Count period; eBird observers for the month were off about 10% and that weekend typically produces additions to that number.

Overall, the Christmas Bird Count season went very well. The Letchworth-Silver Lake CBC was again hit with bad weather and held to 66 species plus seven added during the count week period. The other two counts were above average, with Rochester at 96 (102) species and Conesus-Hemlock at 87 (89) species. As these counts are well summarized elsewhere, we will just hit the highlights here. New highs or ties reported were: Letchworth-Silver Lake – Snow Goose (68); Rochester – Cackling Goose (5), Harlequin Duck (2), Ruddy Duck (32), Red-bellied Woodpecker (197), American Crow (35,471), and American Pipit (1), plus

two new species for the count – Sanderling and **Great Cormorant**; and Conesus-Hemlock – Wild Turkey (126), Northern Harrier (35), Lesser Black-backed Gull (3), Yellow-bellied Sapsucker (4), Tufted Titmouse (190), Marsh Wren (1), Carolina Wren (49), Eastern Bluebird (131), and Yellow-rumped Warbler (19), plus Golden Eagle new for the count.

All the expected waterfowl species were reported in each month, with the possible exception of Ruddy Duck, missed in February, when there are usually a few around on opening lakes. Mostly, numbers were on the low side other than the few annual gatherings where expected, e.g., Long-tailed Duck along the Lake Ontario shore, Redhead on Conesus Lake, and Ring-necked Duck on Hemlock Lake. Mergansers were generally a bit scarce. Rarer species included: a Ross's Goose in January; Greater White-fronted and Cackling Goose in each month; female King Eiders in December and February; a very rare immature male **Common Eider**, first found in late January and then thru the season; a pair of Harlequin Ducks off the Town of Greece all season after mid-December; and a couple of reports of Barrow's x Common Goldeneye in January. The January State Waterfowl Count was again hit with the serious arrival of "real winter" and iffy weather through the count period. Species were down a bit at 31, but most of the expected were spotted somewhere. Total individuals was down about 20% at 41,613, but that is still above the long-term average. Again this year, Canada Goose and Redhead led the totals. On into February, there was only minimal sign of spring increases on patches of open water on Braddock Bay. The arrival of Snow Goose, often in good numbers in February, was noted around us but did not make it to Region 2 as the season ended. But stay tuned for the spring report!

Among the grebes, numbers were very low other than a good count of 826 Red-necked Grebes off Hamlin Beach on 14 December by Andy Guthrie, and then a good count for January of 64 off Benedict Beach on the 1<sup>st</sup>. The lone **Eared Grebe** of the season was spotted by Chris Wood at Hamlin Beach on 26 December. The only rail of the season was a Virginia Rail heard by Andy Guthrie and Chris Wood on the Rochester CBC in the Beatty Point marshes in Greece. Sandhill Crane continued to amaze, with **300-307** tallied in the Northern Montezuma Wildlife Management Area (NMWMA) in the Armitage and Olmstead Roads area in southern Wayne County from 1-10 December and then to 91 still at the NMWMA (Carncross Road) area to 5 January. There were also 10 individuals seen off and on all season from the Honeoye WMA to the Livonia area in Ontario and Livingston Counties.

Some winter seasons, shorebirds can be an empty slot. This season, there were some interesting observations. There were 1-2 Sanderlings seen off and on along the edge of Lake Ontario in the Town of Greece, with two at the Braddock Bay barrier beach island on 5 December and one at various sites through month's end and then one from 12-15 January at the north edge of Irondequoit Bay. There were up to five scattered Purple Sandpiper reports in December, with one to 21 January at Braddock Bay. Single Wilson's Snipe were found on 20 January and 16

February, and a Red Phalarope was at Sodus Point on 4 December. Killdeer was the first spring shorebird arrival, with two in Scottsville on 22 February.

A surprise carryover from the fall incursion was a **Razorbill** spotted near Round Pond Outlet, Greece on 12 December by visiting birders, David Benvent and Ryan Zucker, here for another rarity and taking a look at the lake. **Razorbill** was also seen with later reports off Manitou Beach and Edgemere Drive, Greece on 26 and 27 January by Mitchell Barry, Jessie Barry, and Chris Wood.

Gull variety and numbers were relatively low, though there were ok numbers of the usual Iceland, Lesser Black-backed, and Glaucous Gulls of winter here. The lack of open-water ice edges on the ponds and offshore ice floes limits observations of these. Black-legged Kittiwake was sighted on 3 and 30 December. Low numbers of Bonaparte's Gull continued through late January, then one report of ten was noted on 5 February and no more until spring. Two reports of the rare hybrid **Herring x Lesser Black-backed Gull** were posted on 2 and 4-5 January off Greece and on 9 January at Sodus Bay, Wayne County.

Wrapping up the water-related birds, we start with loons scarce, and Red-throated out numbering Common Loons. Double-crested Cormorant continued in double digit numbers, with up to 41 at Sodus Point to 5 December and to 23 at the usual Newport marina on Irondequoit Bay until 12 January. Numbers then dropped to few individuals, as expected in later winter. A highlight of the Rochester CBC was an immature **Great Cormorant**, new for the count, spotted off Greece by Jessie Barry, Andy Guthrie, and Chris Wood, and seen later by at least six others with photos obtained. A Great Egret, seen by Osvaldo Araya and nine others in the Conesus Inlet WMA from **2-4 December**, tied the Regional record late date for the species.

Next, the vultures and the diurnal raptors. We started with numbers up a bit in the warm December. Continuing the long trend, the Cooper's Hawk:Sharpshinned Hawk reports ratio ran from a start at 5:1 to 3:1 for the season. Bald Eagle counts remained good and Red-shouldered Hawks few. Numbers generally dropped off some later with the increasing cold and snow, but there were some good concentrations of Northern Harrier and at least three locations with Red-shouldered Hawk. Surprises were the Conesus-Hemlock CBC first Golden Eagle on 26 December and then another Golden Eagle found in the town of Ogden by Dave Tetlow on 26 February. The only **Northern Goshawk** of the season was spotted passing off Edgemere Drive, Greece on 25 January by Chris Wood. Rough-legged Hawk provided an opportunity to discuss the need to examine data in some detail. Numbers of "reports", as lines in eBird downloads, varied greatly across months and year to year, but likely numbers of individuals were very similar. This year, a few individuals hung out in the general Braddock Bay area much of the season generating many reports for the few birds. I assembled information for any who might be interested in the issues around determining numbers; none were. An added piece of good news was that David Brown would be returning as the official Braddock Bay hawk counter this spring!

Owls, too, provided a bit more to look at than some years. Good listening weather resulted in good numbers of Eastern Screech-Owl for both the Rochester and Conesus-Hemlock CBCs, 77 and 49, respectively. Snowy Owl also had a decent showing, with about 12-15 individuals reported each month of the season. An interesting personal surprise for me came during the Rochester CBC when scanning Lake Ontario from the East Manitou Road overlook, first in the morning and later in the afternoon. I observed and followed for some time on two occasions different Snowy Owls about a mile offshore apparently hunting ducks and/or gulls over open water. I passed this along to our Snowy expert, Tom MacDonald, and he was not surprised and was interested in the details. More and more is being learned of the species as a primary marine-habitat predator. The Short-eared Owl picture was of relatively low numbers in this year's DEC monitoring efforts. On 1 January Dave Tetlow checked the usual Bergen Swamp sites and logged two Northern Saw-whet Owls. Data from Jim Adams on the usual owl counts from the Owl Woods area along Manitou Beach Road totaled 17 Northern Saw-whet Owls in February, a new high for the month since Jim has summarized the numbers. There were also reports of Long-eared Owl there on two dates, possibly lingering from earlier sightings there.

Finishing the non-passerines, we have the usual couple of woodpeckers of interest, with Yellow-bellied Sapsucker again present in very good numbers, though down some from the last two bonus years, and Red-headed Woodpecker missed for the season. This part ends with the usual comment of the regular falcons all present in good numbers all season.

The passerines followed the trend of expected species being reported each month. The question is always how to cover this big group capturing interesting pieces in reasonable space. This winter, there were no major irruptions. There was only one occurrence of Bohemian Waxwing from 31 December to 1 January and few Cedar Waxwings. Winter finches were scarce, mostly Common Redpolls and Pine Siskins and a few isolated reports of Evening Grosbeak and both crossbills. Snow Bunting and longspurs were hard to find until there was snow cover. There were no major gatherings of blackbirds in the Region. A few special occurrences included: the Region's second latest Black-and-white Warbler to **4 December**, a record late Yellow Warbler on **8 December**, a CBC high 19 Yellow-rumped Warblers on 26 December, a surprising three male Baltimore Orioles reported in January, and then the bird of the season, with Mary Hadley finding a male **Painted Bunting** at her feeder in the Town of Greece on 11 December and alerting the birding community and helping arrange access. It was the Region's second for the species and at least 93 observers reported sightings to eBird through the 14<sup>th</sup>. From here, we could wander through the litany of the many lingering half-hardy species. But the list is similar most years and there is always the question of where the line lies between surprises and fairly regular winter birds in just varying numbers. There were 18 species that fall in this group, with all present in January, Savannah Sparrow and Eastern Towhee missed in December, and Marsh Wren, Gray Catbird, American Pipit, Swamp Sparrow, and Eastern Meadowlark missing in

February. This season, we did see a significant fall off in several of the species in February beyond the usual drops of the past couple of years. For illustration, some of those still present (with some numbers in parentheses) included: Winter Wren (5), Ruby-crowned Kinglet (1), Hermit Thrush (12), Eastern Towhee (1), Chipping Sparrow (1), Field Sparrow (5), Savannah Sparrow (1), Fox Sparrow (max. 2), many White-crowned and White-throated Sparrows, and Yellow-rumped Warbler (7 reports of 1-3). As usual, noteworthy records tables on the Rochester Birding Association website have more detailed records.

A major problem in assembling these reports is trying to select material of likely interest to readers. The overall data set is very large. Birds reported depend on weather, timing, the presence of special species of interest to many, etc., etc., .... It would be a great help if even occasionally there were some feedback from readers. What would you, the readers, like to see more or less of in these reports?

**Snow Goose:** max 3000 T Richmond, ONTA 26 Dec (KKi, WS, SH); 5 CL-N 3 Jan, month max; 50 NMWMA (MR) 23 Feb, month max.

**Ross's Goose:** 1 ad H, mult loc 12-14 Jan (AGU, 11+ oth obs).

**Greater White-fronted Goose:** 3 ad H, mult loc 1, 2, 24 Dec, 1-16 Jan (mob); Silver Lake, WYOM 4 Jan (BCar); IB 21 Feb (CGi, RRe); still a scarce visitor.

**Brant:** last ED nr Lake Ontario shore thru 17 Dec, lingering on lawn and breakwall, many ph.

**Cackling Goose:** 24 rep, ~55 ind 16+ loc Dec; max 7 T Parma 11 Dec (MBa); 21 rep,

~21 ind 15 loc 1-19 Jan; max 7 Silver Lake, WYOM 4 Jan (BCar); 2 BB 21 Feb.

**Canada Goose:** max 8000 TCEA 9 Dec (MW); 600 T Lyons, WAYN 18 Feb, very low Feb max.

**Snow x Canada Goose:** Church Rd area, H 13 Dec (AGU, 5 oth obs); Shore Acres, H 2-3 Jan (AGU).

**Mute Swan:** max 378 RCBC 19 Dec; 230 BB 30 Jan (KH); 260 BB 22 Feb (AGU); too many.

**Trumpeter Swan:** max 21 NMWMA (SCU) 6 Jan (KCa, GG).

**Tundra Swan:** max 160 T Savannah, WAYN 20 Dec (JRo).

**Wood Duck:** 1f last Turning Pt P, ROCH 17, 29 Dec (CBr, KE); T Richmond, ONTA 8 Jan (DT); ED 2 Feb (JeB); Burger P, G 21 Feb (MBa); 2 arr Cuylerville Rd, LIVI 23 Feb (TL).

**Northern Shoveler:** 13 ponds area G 24 Dec-3 Jan (mob); 1-3 IB to BB 17-20 Feb (7 obs); 2 SPT 10, 27 Feb (TL, MT).

**Gadwall:** max 40 Crescent Beach, G 19 Dec (RB, JuW, NK), decent count.

**American Wigeon:** last Bear Crk Harbor, WAYN 30 Dec (JWi); 1-3 ind 8 loc Jan (26+ obs), usually scarce in winter; arr 4 BB & SPT 12 Feb (AGu, JWi); max 22 BB 26 Feb (AGu).

**Mallard:** max 1538 CL 16 Jan (MW); 540 Seneca P, ROCH 10 Feb (LBer), usual winter huddle.

**American Black Duck:** 150 CL-W 6 Jan (TBo), good count.

**Northern Pintail:** 15 BB-ES 25 Dec (CW); 8 NMWMA (AR) 1 Jan (DT); arr 4 SPT 11 Feb (K&MG); max 70 BB 22 Feb (AGu).

**Green-winged Teal:** last Alder Beach, T Parma 18 Dec (JiM); 7, 2 Mumford, MONR 21, 31 Jan (R&SSp); max 12 Cold Spring Rd Pd, LIVI 25 Feb (MW).

**Canvasback:** max 20 BB 28 Feb (PMar), low max.

**Redhead:** 3500 CL 26 Dec (JKi); 5952 CL 16 Jan (MW).

**Ring-necked Duck:** max 500 Hemlock L P 5 Jan (J&BVDM).

**Greater Scaup:** max 430 BB 22 Feb, low max.

**Lesser Scaup:** max 120 CL 26 Dec, low max.

**scaup sp.:** max 1000 IBO 1 Jan, interesting, but not high.

**King Eider:** 2 f HB 10 Dec (AGu); 1 f HB-WE 26 Dec (CW); 1 f Lake Ontario shore just e of BB 2, 12, 14 Feb (JiM, RB, AGu, MBa).

**COMMON EIDER:** 1 imm m Genesee R mouth 27-28 Jan (NU, 22+ oth obs, phs); scattered sites along Lake Ontario shore west to Manitou Beach off and on thru rest of season (mob); very rare here.

**Harlequin Duck:** 1f & 1m from mostly near Round Pd Outlet, G west to BB area 11 Dec thru (mob, phs); 1f SPT 19 Jan (JWi, MGu, TL, W&MR).

**White-winged Scoter:** max 350 off Rigney's Bluff, G 31 Jan (KH).

**Long-tailed Duck:** 1370 ED 24 Dec (CW); max 5200 Round Pd Outlet to Rigney's Bluff, G bay 22 Jan (R&SSp); 1900 Round Pd Outlet to Rigney's Bluff, G bay 31 Jan (KH); illustration of sometimes brief, local gatherings of species.

**Bufflehead:** max 65 Silver L, WYOM 1 Jan (KKu), low max.

**Common Goldeneye:** max 241 Chimney Bluffs, WAYN 16 Jan (DSh, MT).

**BARROW'S x COMMON**

**GOLDENEYE (R2):** 1 imm m off Manitou Beach 19, 22 Jan (R&SSp); 1 f off Manitou Beach 26 Jan (PMar).

**Hooded Merganser:** max 190 CL-N 14 Dec (TBo).

**Common Merganser:** max 850 Lake Bluff Rd, Irondequoit 7 Feb (MTe), good count after low most of season.

**Red-breasted Merganser:** max 1085 Chimney Bluffs, WAYN 16 Jan (DSh, MT).

**Ruddy Duck:** max 54 Sandy Bottom P, Honeoye L 3 Dec (TBo); no rep Feb.

**Wild Turkey:** max 126 CHCBC 26 Dec, new CBC high.

**Horned Grebe:** max 10 Beechwood SP, WAYN 9 Jan, very low max.

**Red-necked Grebe:** max 826 HB 14 Dec (AGu), good count; 64 Benedict Beach (end Martin Rd), H 1 Jan (JeB, MBa, AGu, CW), late for so many.

**EARED GREBE (R2):** HB 26 Dec (CW), good find.

**Virginia Rail:** Beatty Pt, G 19 Dec (AGu, CW), heard during CBC work.

**American Coot:** max 92 IB-N 8 Dec, low max.

**Sandhill Crane:** max 300-307 NMWMA (AR & Olmstead Rd) 1-10 Dec (AJ, PS, KGa); 10 Honeoye WMA, ONTA to T Livonia, LIVI 26 Dec-15 Feb (KKi, WS, SH, BHo, KGa, DD, PMar, oth obs); 91 NMWMA (CR) 5 Jan (W&MR); continuing increases in Reg.

**Killdeer:** arr 2 Scottsville, MONR 22 Feb (BHaa).

**Sanderling:** 2 BB-ES 5 Dec (MGi, ph); 1 OB area to BB 15-31 Dec, 1, 8 Jan (JiM, mob); IB-N 12-15 Jan (12+ obs), likely same ind.

**Purple Sandpiper:** Summerville Pier 16-17 Dec (LP, 5 oth obs, ph); BB-WS 17 Dec (DF); IBO 25 Dec (CW, mob, ph); 1; 2 BB-ES 27-29; 30 Dec (MBa, mob, phs); last BB-ES 1-2 Jan (15+ obs).

**Wilson's Snipe:** T Ogden, MONR 20 Jan (DT); BB-ES 16 Feb (JGo).

**Red Phalarope:** last SPT 4 Dec (MMi, mob).

**RAZORBILL:** off Round Pd Outlet, G 12 Dec (DBen, RZ), *intro*; off Manitou Beach 26 Jan (MBa); ED 27 Jan (JeB, CW); likely still in lake basin from fall incursion.

**Black-legged Kittiwake:** 1 imm HB 3 Dec (AGu, phs); 1 imm OB 30 Dec (CW).

**Bonaparte's Gull:** max 59 IB-S 1 Dec, low max; 10 IBO 5 Feb (CBra), only Feb rep.

**Ring-billed Gull:** max 4000 IBO 18 Feb (CBra), good count.

**Herring Gull:** 2000 BB 4 Jan (AGu), good count.

**Iceland Gull:** 10 ind 7 loc 4-31 Dec; 11 rep, ~13 ind 6 loc Jan; 16 rep, ~14 ind 6 loc Feb.

**Lesser Black-backed Gull:** 10 rep, 10 ind 9 loc Dec; 10 rep, ~10 ind 7 loc 4-31 Jan; 8 rep, ~7 ind 4 loc 11-27 Feb.

**Glaucous Gull:** 33 rep, ~21 ind 15 loc Dec; 25 rep, ~17 ind 13 loc Jan; 6 rep, ~6 ind 5 loc 11-26 Feb.

**Great Black-backed Gull:** max 68 IB – Bay Village 17 Feb (NU).

**Herring x Lesser Black-backed Gull:** Buck Pd, G & BB 2 & 4-5 Jan (CW & AGu); Sodus Bay – Shaker Tract 9 Jan (TL).

**Red-throated Loon:** max 15 OB area 24 Dec; 10 IB – Newport marina 1 Jan; otherwise low numbers thru.

**Common Loon:** low numbers thru.

**GREAT CORMORANT (R2):** 1 imm off G 19 Dec (JeB, AGu, CW, 6+ oth obs, phs), first for RCBC.

**Double-crested Cormorant:** max 41 SPT 5 Dec (AGu, BriM); 23 IB – Newport marina 12 Jan (RSp), last higher count for season.

**Great Egret:** Conesus In WMA 2-4 Dec (OA, 9+ oth obs, phs), ties Reg record late

**Turkey Vulture:** max 49 T Lima 8 Jan (DT), good winter count.

**Golden Eagle:** CHCBC 26 Dec (sev obs), CBC first; T Ogden, MONR 26 Feb (DT); few winter reports.

**Northern Harrier:** max 35 CHCBC 26 Dec, new CBC high.

**Sharp-shinned Hawk:** 70 eBird lines many loc Jan; 45 eBird lines many loc Feb.

**Cooper's Hawk:** 209 eBird lines many loc Jan; 153 eBird lines many loc Feb.

**Northern Goshawk:** ED 25 Jan (CW), passing bird, reports few now.

**Bald Eagle:** 281 eBird lines 96+ loc Dec; 345 eBird lines many loc Jan; 282 eBird lines many loc Feb.

**Red-shouldered Hawk:** Nations Rd IBA 30 Dec (JMon); N Wolcott, WAYN 2, 12, 20 Feb (W&MR); Nations Rd IBA LIVI 20 Feb (KCl); Parker Hill Rd, T Sparta, LIVI 21 Feb (KCl).

**Rough-legged Hawk:** 39 rep, ~14 ind 15+ loc 5-31 Dec; 84 rep, ~16 ind 17 loc Jan; 57 rep, 22+ ind 18+ loc Feb.

**Eastern Screech-Owl:** 77 RCBC 19 Dec; 49 CHCBC 26 Dec; good counts.

**Snowy Owl:** 40 rep, ~15 ind 19 loc Dec; 2, 8:25 AM & 3:20 PM, off East Manitou Rd overlook 19 Dec (RSp), different birds hunting over open water about 1 mile offshore, *intro*; 43 rep, 14 ind 15+ loc Jan; 41 rep, 12+ ind 10 loc Feb.

**Long-eared Owl:** M (OW) 6 Jan (JiM); BB area 22-23 Jan (QM, ES); M (OW) 20, 27 Feb (6+ obs); scarce in winter.

**Short-eared Owl:** max: 10 Nations Rd IBA 5 Feb (MT).

**Northern Saw-whet Owl:** 2 Bergen Swamp 1 Jan (DT); total 17 ind M (OW) Feb (BBRR counters), highest for a Feb, *intro*.

**Red-headed Woodpecker:** no reports.

**Red-bellied Woodpecker:** max 197 RCBC 19 Dec, CBC record high.

**Yellow-bellied Sapsucker:** total ~25 ind 25 loc Dec; 55 rep, ~36 ind 33+ loc Jan; 20 rep, 12 ind 11 loc 1-23 Feb, drop off late.

**American Kestrel:** 57 rep, ~34 ind 29+ loc Dec; 77 rep, ~33 ind 31 loc Jan; 47 rep, 21 ind 14+ loc Feb.

**Merlin:** 54 rep, ~49 ind 45 loc Dec; 43 rep, 41+ ind 36+ loc Jan; 28 rep, 22 ind 22 loc Feb.  
**Peregrine Falcon:** 26 rep, ~21 ind 18 loc Dec; 26 rep, 16+ ind 15 loc 4-31 Jan; 26 rep, ~12 ind 12 loc 7-22 Feb.

**Northern Shrike:** 36 rep, ~17 ind 15 loc Dec; 30 rep, ~11 ind 11 loc 1-22 Jan; 7 rep, ~6 ind 3 loc Feb.

**American Crow:** max 35,471 RCBC 19 Dec, new CBC high, Douglas Bassett tallied 34,900 of these at Frontier field; 1200 T Fairport 30 Jan (D&ER), good count; 900 LB Farm, T Savannah, WAYN 19 Feb (B&LG), interesting gathering site.

**Fish Crow:** 6 OB area 30 Dec, month's max; 10 Northgate Plaza, G 1 Jan, month's max; total 12+ ind 8+ loc Feb, spreading out more.

**Black-capped Chickadee:** 1194 eBird lines Dec; 1417 eBird lines Jan; 1429 eBird lines Feb; illustrates many reports for common birds; down from 2021.

**Tufted Titmouse:** max 190 CHCBC 26 Dec, new CBC high; 952 eBird lines Jan; 1015 eBird lines Feb.

**Horned Lark:** max 150 Church Rd, H 23 Jan, good count.

**Ruby-crowned Kinglet:** Tryon P – N, Irondequoit 17 Dec (SG); York Rd, T Leroy 2 Jan (NK); Chimney Bluffs, WAYN 7 Feb (MGU); usually scarce in winter.

**Bohemian Waxwing:** 3 nr Newco Dr, H 31 Dec (AGU, LBER, KH); 1 nr Newco Dr, H 1 Jan (JeB, MBa, CW), continuing; only reps.  
**Cedar Waxwing:** max 140 nr Newco Dr, H 31 Dec (AGU), generally scarce this winter.

**Red-breasted Nuthatch:** 218 eBird lines Dec; 313 eBird lines Jan; 276 eBird lines Feb; many reps continuing thru, but well down from 2021.

**White-breasted Nuthatch:** 793 eBird lines Dec; 945 eBird lines Jan; 905 eBird lines Feb; many reps continuing thru.

**Winter Wren:** 62 rep, ~58 ind 39 loc Dec; 37 rep, 25 ind 18 loc Jan; 6 rep, 5 ind 5 loc 1-19 Feb; many for winter.

**Marsh Wren:** total ~14 ind, 9 loc 5-29 Dec; total ~5 ind, 5 loc 1-16 Jan.

**Carolina Wren:** max 49 CHCBC 26 Dec, new CBC high.

**Gray Catbird:** total 8 ind 7 loc 8-28 Dec; total ~7 ind 6 loc Jan; total 5 ind 5 loc Feb, usually scarce in winter.

**Brown Thrasher:** Webster P 23 Dec; 2 Jan (GL, JiM, JJu; KH), rare in winter.

**Eastern Bluebird:** max 131 Conesus-Hemlock CBC 26 Dec, new CBC high; 24 nr Newco Dr, H 3 Jan (AGU), many for loc & date.

**Hermit Thrush:** 36 rep, ~34 ind 22+ loc Dec; 40 rep, ~33 ind 26 loc Jan; 15 rep, ~12 ind 10 loc 2-22 Feb; usually scarce in win.

**American Robin:** max 1880 BB-ES 30 Jan (CW), high for date.

**American Pipit:** BB-ES 19 Dec (RB, ph, GL, JuW); BB – Buttonwood Crk 1 Jan (JeB, MBa, AGU, CW); scarce in winter.

**Evening Grosbeak:** 2 nr Newco Dr, H 1 Jan (JeB, MBa, AGU, CW), only rep.

**Common Redpoll:** monthly max: 90 DEP 18 Dec (AGa); 120 H 4 Jan (ABl); 60 Newco DR, H 13 Feb (RB, LBER).

**Red Crossbill:** HB-WE 21 Dec (CW); max 20 Hoffman Rd, Irondequoit 8 Jan (LBER).

**White-winged Crossbill:** WP 8 Dec (NU).

**Pine Siskin:** max: 50 W 27 Feb (AGa).

**Lapland Longspur:** max 17 Church Rd, H 17 Jan (AGU).

**Snow Bunting:** 155 BB-ES 30 Dec (NK); 220 T Groveland, LIVI 19 Jan (J&KG); max 350 T Groveland, LIVI 10 Feb (J&KG).

**Chipping Sparrow:** Quaker Rd, Scottsville 9-27 Dec, 7-27 Jan (BHaa, ph); Hoffman Rd, Irondequoit 16 Jan (CW); T Webster 5 Feb (RSp); usually scarce in winter.

**Field Sparrow:** Poplar Hill Rd, T Lima 26 Dec (RB, JuW, RRe); BB-ES 31 Dec (DSt); 4 NMWMA (MR) 8 Jan (DSh); total 5 ind 4 loc 2, 18-20 Feb (Sobs); usually scarce in winter.  
**Fox Sparrow:** MP 1 Dec (DHo); Burger P, G 1 Jan (JeB, MBa, AGU, CW); 1-2 MP 15-30 Jan (J&TV, 16 oth obs, phs); Hogan Pt, G 20, 24 Jan (DT); 5 rep 1-2 ind MP 2-11 Feb (sev obs); usually scarce in winter.

**American Tree Sparrow:** max 110 T Mt Morris, LIVI 20 Jan (DT) & Church Rd, H 21 Jan (AGU).

Unidentified *Larus*, Old Field Point, *Suffolk*; top: 23 Feb 2022 © Barbara LaGois; bottom: 22 Feb 2022, © Patrice Domeischel. See next page.

Presumed hybrid Lesser Black-backed x Herring Gulls, Stevenson Road Game Farm and Compost, *Tompkins*; left: 20 Mar 2016 © Ian Davies; right: 9 Mar 2022 © Jay McGowan.

Unidentified *Larus*, Old Field Point, *Suffolk*, 22 Feb (left) & 23 Feb (right) 2022, © Patrice Domeischel. Based on overall structure, mantle tone, and wingtip pattern, this bird is thought possibly to be a European Herring Gull (*L. a. argentatus*), northern populations of which have darker mantles than other Herring Gulls, reduced black in the wingtips, and frequently show yellow legs. Presumed hybrids between Lesser Black-backed and Herring Gulls are similar but typically show more black in the wingtips, duller legs, and other differences. See Note on pp. 136-139.

**Dark-eyed Junco:** monthly max: 40 DEP 23 Dec (JSI); 82 T Leroy, GENE 21 Jan (DT); 57 LB Farm, WAYN 19 Feb (B&LG).

**White-crowned Sparrow:** max 31 CHCBC 26 Dec, new CBC high; 30 Chase Rd, H 15 Jan (R&SSp, ph); 132 eBird lines Feb.

**Common Grackle:** max 200 T Rush, MONR 29 Dec (SSh), low max.

**blackbird sp:** max 650 River Rd N of Rt 5, LIVI 5 Jan (NK).

**Black-and-white Warbler:** Abraham Lincoln P, T Penfield 4 Dec (SG, AGu, JiM, TN), second latest Reg.

**Common Yellowthroat:** NMWMA (Deep Muck) 1 Dec (SPod), late.

**Yellow Warbler:** IBO 8 Dec (NU), Reg record late.

**Yellow-rumped Warbler:** max 19 CHCBC 26 Dec, new CBC high; total ~17 ind 16 oth loc Dec (20+ obs); 11 rep, 16+ ind 11 loc Jan; 7 rep, 1-3 ind 4 loc 1-21 Feb (5 obs); often scarce in winter.

**Northern Cardinal:** 1116 eBird lines Dec; 1668 eBird lines Jan; 1800 eBird lines Feb; many reports.

**PAINTED BUNTING:** 1 ad m Webwood Circle, G 11-14 Dec (Mary Hadley, 93+ oth obs, phs), second Reg record, *intro*.

## REGION 3—FINGER LAKES

**Bill Ostrander**

80 Westmont Ave., Elmira, NY 14905  
browncreeper9@gmail.com

December 2021 was warmer and slightly drier than normal. At Ithaca, the average low temperature was 27.3° F, 5.3° above normal. The average high was 41.2°, 5.0° above normal. Total precipitation was 2.26", 0.31" less than normal. Total snowfall was 3.7", 8.5" less than normal. Maximum snow depth was one inch, attained on six days. January was colder and drier than normal. The average low temperature was 6.5°, 8.1° below normal. The average high was 27.4°, 3.6° below normal. Total precipitation was 1.28", 0.96" less than normal. Total snowfall was 14.8", 1.8" less than normal. Snow depth twice peaked at eight inches and there was at least one inch of snow cover on all but seven days. February days were warmer than normal, but nights were colder than normal. The average low temperature was 13.5°, 1.6° below normal. The average high was 34.5°, 1.4° above normal. Total precipitation was 2.72", 0.74" more than normal. Total

snowfall was 17.0", 2.5" more than normal. Peak snow depth was 16", with at least one inch of snow cover on all but two days.

Two species of waterfowl were found in high numbers: Green-winged Teal in early December and Common Mergansers in mid-January. The early mild weather allowed the teal to linger into December when they are usually scarce. Conversely, the very cold January weather resulted in the freezing of shallow water bodies and portions of rivers which may have caused the concentration of Common Mergansers on the larger lakes. Unusual waterfowl included Ross's Goose at four locations and Greater White-fronted Goose at three. Unusual ducks were a Tufted Duck on Seneca Lake in late January, a Black Scoter on Cayuga Lake in early December, and a Barrow's Goldeneye on Seneca Lake the last half of February. An Eared Grebe was on Seneca Lake in mid-February and a couple of Red-throated Loons were on Cayuga Lake in early December. There was a high count of Double-crested Cormorants in mid-January on Seneca Lake.

Sandhill Cranes set another winter record with 400 at Montezuma National Wildlife Refuge in mid-December. A Red Phalarope was on Seneca Lake through the first half of December. There were high counts of Iceland Gulls in late January and of Glaucous Gulls in late February.

Among raptors, observers found high counts of Black and Turkey Vultures, Northern Harriers, and Snowy Owls. The only report of Northern Goshawk came from Chemung County.

There were high counts of Northern Flickers and American Robins in mid-December, and of Red-bellied Woodpeckers, Tufted Titmice, White-breasted Nuthatches, Winter Wrens, and Carolina Wrens in early January.

Winter finches were scarce. Nevertheless, Purple Finches, Common Redpolls, Red Crossbills, Pine Siskins, and a single Evening Grosbeak made appearances. The mild weather in December resulted in many lingerers: an Eastern Phoebe, a Blue-headed Vireo, a high count of Ruby-crowned Kinglets, a Blue-gray Gnatcatcher, a House Wren, a Marsh Wren, Gray Catbirds, a Brown Thrasher, Hermit Thrushes, American Pipits, Chipping Sparrows, a Clay-colored Sparrow, Fox Sparrows, White-crowned Sparrows, Savannah Sparrows, Eastern Towhees, a high count of Eastern Meadowlarks, a Baltimore Oriole, and Common Yellowthroats.

A Fox Sparrow arrived on the early date of 16 February. White-throated Sparrows set a high count in mid-February. Rock Pigeons, European Starlings, and House Sparrows all made their marks. European Starlings set a new high count. The season's maximum counts of Rock Pigeons and House Sparrows were new lows.

## REGION 4—SUSQUEHANNA

**Lance Verderame**

8 Elm Hollow Road, Livingston Manor, NY 12758  
flybynight9@hvc.rr.com

Weather data obtained from the Binghamton Station showed a high of 60° F on 16 December and a low of 15° on 20 December. The average temperature for the month of December was 34.2° which was 6.1° above normal. December precipitation was 2.85" which was 0.23" below normal. The high temperature for the month of January was 51° on 1 January and the low was -10° on 22 January. The average temperature for January was 17.6° which was 4.9° below normal. January precipitation was 1.90" which was 0.72" below normal. For the month of February the high temperature was 56° on 22 February and a low of 1° on 6 and

14 February. The average temperature was 25.2° which was 0.7° below normal. The precipitation for February was 3.33" which was 0.92" above normal.

As usual, waterfowl was very well represented in the period with some very nice reports. Trumpeter Swans were reported in both Broome and Delaware Counties. To the best of my knowledge the three birds found in Delaware County are a first county record. Both Broome and Delaware Counties also had the only reports of Cackling Goose. Both Mute and Tundra Swan were reported in the Region as well. Sea ducks such as White-winged Scoter, Long-tailed Duck, and Red-breasted Merganser were reported throughout the Region.

It is always fun in winter to look for gulls and this year five species were reported. There was only one report of Bonaparte's Gull (4) On Boland Pond. This year they were dumping waste close to Route 10 at the Delaware Waste Facility. There was a Regional high of 350 Ring-billed Gulls found there on 5 December. Also found there by the author was a crisp looking first-year Iceland Gull on 5 February. A Region-high 45 Herring Gulls were present at Skaneateles Lake on 21 February, and last but not least, two Great Black-backed Gulls were recorded at Cortland Gravel Pits on 26 February.

The irruption of Red Crossbills in the state this winter, mainly in the Adirondacks, reached Region 4 as well, and among the many, widespread reports were observations of singing, courtship, and display, indicating possible or probable nesting.

Other interesting reports for the period include a very late Spotted Sandpiper, seen and photographed by Glenn Wilson at Dorchester Park on 28 December. While very scarce, there were some scattered reports of Common Redpolls and Evening Grosbeaks in the Region. Northern Shrike was report in a few locations as well.

My pick for bird(s) of the Region for the period goes to the two Short-eared Owls reported in the Newark Valley Area in Tioga County. The birds were originally found by Adam Troyer.

**Double-crested Cormorant:** OtsL 10 Dec. (SS); DorP 10-24 Dec. (DA,DN,GW); Oneonta (OTSE) 15 Jan. (MG); Deposit 16 Jan. (LV).

**Great Blue Heron:** scattered reports in all counties in Region.

**Turkey Vulture:** ULCP 21 Feb. (DN,DW); 7 Endwell (BROO) 21 Feb. (MPH); a few other scattered reports of single birds in BROO.

**Golden Eagle:** scattered reports of single birds throughout Region.

**Northern Harrier:** numerous reports of mostly single birds throughout Region.

**Sharp-shinned Hawk:** reported in all counties in Region.

**Cooper's Hawk:** reported in all counties in Region.

**Northern Goshawk:** ChenL 3 Dec. (MD); Oxford 9 Dec. (MD); Richford (TIOG) 11 Jan. (DM).

**Bald Eagle:** common throughout entire Region.

**Red-shouldered Hawk:** scattered reports of single birds in BROO, CHEN, DELA and TIOG counties.

**Rough-legged Hawk:** 2 Meredith 29 Jan. (LV); 2 Kilroy Rd (CHEN) 1 Feb. MD); 2 E. River Rd (TIOG) 13 Feb. (DG); many other reports throughout entire Region.

**Eastern Screech-Owl:** scattered reports in BROO, CHEN, OTSE and DELA.

**Great Horned Owl:** scattered reports in all counties in Region.

**Snowy Owl:** ill bird captured in New Berlin (CHEN) on 1 Jan. (KD). The bird was brought to a rehab center and subsequently brought to Cornell. Happily the bird recovered from dehydration, an injured wing, and rat poison and was released on the finder's farm in Otsego Cty on 31 Jan. (Pictures of release on eBird). A tough bird indeed.

**Barred Owl:** scattered reports in all counties in Region.

**Short-eared Owl:** Center Lisle 10 Dec. (DG); 2 Newark Valley TIOG 10 Dec, 3-8 Jan. (ATro,WB,DG,DM).

**Northern Saw-whet Owl:** Hancock (DELA) 8 Jan. (LV); Deposit 22 Feb. (LV).

**Belted Kingfisher:** reported in all counties in Region.

**Yellow-bellied Sapsucker:** LPSF 21 Dec. (ATri); Fly Creek (OTSE) 24 Dec. (DM); Bainbridge 30 Jan (RB); cluster of reports in Binghamton area as well.

**Northern Flicker:** reported in all counties in Region. Majority in BROO and TIOG.

**American Kestrel:** reported throughout entire Region.

**Merlin:** DorP 1 Dec. (WK); Cortland 6 Dec. (DG); Springfield Ctr (OTSE) 13 Jan (ML); other reports of single birds in BROO and TIOG counties.

**Peregrine Falcon:** 2 Region max Binghamton 1 Jan – 6 Feb. (WK); reports of single birds in CHEN, CORT, OTSE and TIOG.

**Northern Shrike:** LPSF 20 Dec. (MD); Vestal (BROO) 28 Dec.-16 Jan. (MJ, mob); BMF 6 Jan (ATro); ULSP 11 Jan. (GW); Cincinnati (CORT) 9 Feb. (SD).

**Fish Crow:** Lisle 1 Jan. (DW); many reports in BROO and TIOG along SusRB.

**Horned Lark:** 100 Region max Currie Valley Dairy 26 Feb. (ST,LC); reported in all counties in Region.

**Ruby-crowned Kinglet:** BPd 13 Jan. (DN).

**Cedar Waxwing:** 200 Region max Whitney Pt. (BROO) 1 Jan. (JW); many other reports throughout entire Region.

**Winter Wren:** 2 BUNP 18 Dec. (SW); 2 SkaL 18 Dec. (BM,MY); 2 Downsville 12 Feb. (LV).

**Marsh Wren:** BPd 20 Dec. - 2 Jan. (DN,mob).

**Brown Thrasher:** Chenango Forks (CHEN) 8 Feb. (LH).

**Northern Mockingbird:** BMF throughout period (ATro); StPd 21 Dec.-26 Feb. (ST,LC,DG); W. Newark (TIOG) 15 Jan. (MJ); Richford (TIOG) 23 Jan. (JM).

**Hermit Thrush:** BUNP 14-18 Dec. (SW,BJ); Victory St. Marsh (BROO) 4 Jan. (DN); Johnson City (BROO) 5 Jan. (GW); Anson Rd. (BROO) 9 Jan. (MJ).

**American Pipit:** Binghamton 19-27 Jan. (DW,GW,mob).

**Evening Grosbeak:** S. Otselic (CHEN) 16 Jan. (MF); Franklin (DELA) 18 Feb. (JH); Papish Pd 26 Feb. (CW).

**Common Redpoll:** Scott (CORT) 20 Feb. (PH); 2 Hobart (DELA) 20 Feb. (LL); 3 High Vista Pres. (CORT) 26 Feb. (CW).

**Red Crossbill:** 14 site max Beaver Dam State Forest (TIOGA) 12 Jan. (WB); 15 Region max Pitcher Springs State Forest 13 Feb. (DN); many, widespread reports 8 Dec – 26 Feb, involving all counties with the exception of OTSE, possibly nesting, *intro*.

**Pine Siskin:** reported in small numbers in all counties in Region.

**Lapland Longspur:** Huizinga Farm 9 Feb. (DM).

**Snow Bunting:** 27 Delancey (DELA) 29 Jan. (LV); 30 Richfield Springs (OTSE) 1 Feb. (AS); 50 Currie Valley Dairy (CORT) 26 Feb. (ST,LC).

**Chipping Sparrow:** 3 MHL 28 Feb. (WB).

## REGION 5—ONEIDA LAKE BASIN

**David Wheeler**

20 Waterbury Dr., North Syracuse, NY 13212  
tigger64@aol.com

Winter 2021-2022 started with the second warmest December on record. The average maximum temperature of 44.4° F was a whopping 7.3° above normal, with the average minimum of 31.6° an equally-impressive 7.9° above. Only two days failed to crack the freezing mark, while 14 nights never dropped below, both eight fewer than expected. Rainfall was typical but snow was 21.1" less than the average of 30.6", the month's total of only 9.5" making it the eighth lowest ever. As one might expect, half-hardy species lingered through the month. Only seven days were partly-sunny or better, the overcast contributing to mild conditions. Winter would arrive in earnest for the month of January with an average maximum of 29.6°, 2.1° below normal. Skies were clearer than usual with 16 days partly-sunny or better, this leading to cold, clear overnights whose average minimum was only 9.5°, 7.0° below expected. Ten nights dropped below 0° compared to four typical of the month. Snow continued to be scarce with only 23.5" versus the 34.0" norm. February featured a return to warmer temps with the average maximum of 38.4° being 4.8° above normal. Average low for the month was very typical at 17.1°, likely a result of 10 days that were at least partly clear. Eleven days and 24 nights were below freezing, both two less than expected. A meager 20.9" inches of snow completed the season, leaving it 41" off the typical pace. Rainfall was average over the period.

With open fields and mild temperatures early in the season, geese took their time moving through our area. On 5 December Gregg Dashnau found a **Ross's Goose** at Lake Neatahwanta in Fulton, which at the time held a good number of waterfowl including many gulls, geese (Canada and Snow), and Common

Mergansers. The mostly snow-free cut corn fields on Ditch Bank Road produced a **Greater White-fronted Goose** for David Wheeler on 12 January amidst Canada Geese, European Starlings, a few crows, but no gulls. Counts of American Wigeon at Woodman Pond were excellent through December with Richard Cohen following the action with frequent checklists. Decent numbers of Northern Pintail continued there as well, while arriving on the spring end of the season with 300 at the Loop Road floodland on 23 February. Unusual January Green-winged Teal were reported by Wheeler and Dashnau from Verona Beach and Fulton, with Wheeler noting that 5 January was late for an entirely-open Oneida Lake. Mickey Scilingo and Martin Mau found a **Harlequin Duck** at Nine Mile Point on 20 February. King Eider was not reported this period and no dark-winged scoters lingered beyond mid-December. Grebes of all kinds were scarce, possibly a result of mild conditions to our north. Last but not least decent groups of American Coot were present on Onondaga and Skaneateles Lakes at least up to January's abrupt weather change.

The winter gull season was unextraordinary but for a **Slaty-backed Gull** found at the Madison County landfill on 30 December by David Wheeler, his third find of this rare Asian vagrant in the Region. It became a new year-bird two days later but was seen only intermittently on the landfill pond (where it could be easily picked out) versus the high garbage mountain (where it could not). This no doubt disappointed many observers but please remember that the only viewing is from the office parking area on Buyea Road. Realizing the bird should be visiting Ditch Bank and roosting on Oneida Lake west of Lewis Point, Wheeler checked these spots repeatedly and found the bird on the small ice shelf just east of North Main Street Road Extension late in the day on 5 January. This confirmed the bird's daily commute between Oneida Lake and the landfill, via Ditch Bank. It was last noted on 12 January. With plenty of open water in December, small flocks of Bonaparte's Gulls continued with 35 noted from Sandy Pond by Matt Brown on the 5<sup>th</sup>. Oneida Lake also got in on the action but Onondaga missed out. Our usual six species of wintering gulls were noted from typical locations throughout the period. Brown found three Dunlin at Sandy on 14 December plus a Greater Yellowlegs on the 7<sup>th</sup>, both late dates. A presumed spring-migrant Killdeer was found on 24 February near Oswego by Robert Whitman.

A Black-crowned Night-Heron was noted at the Syracuse Inner Harbor by Gregg Dashnau on 2 December. The species has been known to linger in the area. Did this bird stay? Black Vultures continue to have a winter presence, with three noted from Jamesville and four in Little Falls. The Jamesville spot is the Region's most reliable wintering location for Turkey Vultures also, with 41 noted on 15 January by Joe Brin and Renee Kittleman. Mike Tetlow observed nine over Fair Haven on 30 December, an unusual date and location for such a good number moving along the lakeshore. Wintering or migrating Golden Eagles were noted from five locations, all from Madison County and points east. Possibly-resident Northern Goshawks were observed several places, plus a likely wanderer buzzed Matt Brown's feeders in Pulaski. Bald Eagles again wintered in numbers at the

south end of Onondaga Lake with 76 counted by Martin Mau on 2 February. Will the new trail to Murphy's Island change things for them? A first-of-season Red-shouldered Hawk passed Derby Hill on 19 February. Single Snowy Owls were reported from usual locations, while a Long-eared Owl was found in Onondaga Lake Park on 28 January by Aidan Perkins. Dashnau also found one at Three Rivers on 24 February. A pair of Short-eared Owls was found by Tammy Richer on Burnet Road in Clay on 15 February. The houses and fields on either side of the road are slated for destruction and development into a massive industrial park anchored by the recently-announced Micron chip-manufacturing facility. Nothing has been announced but hopefully something can be saved as part of damage-mitigation plans that sometimes accompany such projects.

As noted in the weather summary, an exceptionally mild December led to good numbers of lingering half-hardy types such as Yellow-bellied Sapsucker, Northern Flicker, Golden-crowned Kinglet, Winter Wren, Hermit Thrush, American Robin, White-crowned Sparrow, Swamp Sparrow, Eastern Towhee, Red-winged Blackbird, and Yellow-rumped Warbler. There were better than usual counts and more reported locations for virtually all on this list, at least up to the January deep freeze. While birding the Andrews Road feeder canal on 29 December, a long-known hotspot for lingering birds, Marshall Iliff found a surprising 10 Winter Wrens. White-crowned Sparrows continue to be found more often in sparrow flocks, with 14 seen in Baldwinsville on 18 February by Joe Brin and Renee Kittleman.

It was not a huge winter for irruptive finches. Jonathan Kresge found the only Evening Grosbeak of the season on 12 December in McKeever. Drew Weber found a Pine Grosbeak at Green Lakes State Park on 18 December which stuck around for others to enjoy. Deborah Dohne added one from Onondaga Lake Park's west shore on the 19<sup>th</sup> and another there on the 24<sup>th</sup> was seen by Alex Thor. The Region desperately needs more crabapple trees to hold the ones that do get here. Winter Purple Finches continue to be scarce in the lowlands of the Oneida Lake Basin. Small numbers of Common Redpolls were reported from various locations including 50 at Sterling Nature Center seen by Jim D'Angelo on 31 December. Bill Purcell found Red Crossbills in Atwell which were joined by smaller numbers of the White-winged variety and proved reliable for other observers. Crossbills were also seen at various locations in northern Oneida and Herkimer Counties. Pine Siskins were scarce away from traditional strongholds.

Lapland Longspurs were found in three locations and only 1-2 birds. The first conspicuous flocks of Red-winged Blackbirds and Common Grackles were noted on 22 February, a typical spring arrival date for these. Northern Shrike and Merlin reports were scattered around the Region throughout the period. An Orange-crowned Warbler was photographed by Pam Staves at a feeder in Manlius on 31 January. Though good numbers of the species can be found wintering on the Atlantic coast, this is only the second Regional record for winter and the first for the deep-winter months of January/February. Richard Cohen had good looks at a record late Common Yellowthroat at Woodman Pond on 8 January. Yellow-

rumps were reported from 15 locations, substantially more than usual. None of the five MOTUS stations in the Region picked up any tagged birds during the winter period.

This season a total of 138 species and one hybrid was reported, which is one above the recent 10-year average for the Region. Highlights of the season included: Ross's Goose, Greater White-fronted Goose, Harlequin Duck, **Slaty-backed Gull**, Black Vulture, **Pine Grosbeak**, **Orange-crowned Warbler**, and Common Yellowthroat.

Winter 2021-2022 produced 53,589 eBird records for Region 5, and were processed by Swan Swan Hummingbird v5.5. Reports were submitted by 548 people and the Contributor list assembled as described in previous reports.

**Common Yellowthroat:** WP 8 Jan (RCo), rec late, well described.

**Yellow-rumped Warbler:** 1-4 rep 15 locs var dates, more than usual; max 6 Bville 29 Dec.

=====

## REGION 6—ST. LAWRENCE

**Jeffrey S. Bolsinger**

98 State Street, Canton NY 13617

jsbolsinger@yahoo.com

Winter alternated between mild and seasonably cold, with few lengthy spells of either. December was mostly mild, with a mean temperature in Watertown of 31.7° F, which is 4.4° above normal. High temperatures topped 50° on six days in December, reaching as high as 63° on 17 December, the warmest day of the winter. Mild weather continued into the new year, with a high of 50° on 2 January, but most of that month was cold, as indicated by a mean monthly temperature of 10.6°, which is 9° below normal. Temperatures dropped below zero on the last 11 nights of January, including the season's low of -19° on 30 January, but daytime temperatures during this period often rose into the 20s or even 30s. Temperatures moderated in February, and that month's mean temperature of 21.0° was within 0.3° of normal. About 3.5" of precipitation fell in each of December and January, both totals within 0.3" of normal, but February's 4.6" inches of precipitation was about 2.1" higher than average. Watertown's 36.9" of snow in February was just a couple of inches shy of the total for December and January combined.

Snow Geese barely showed up in Region 6 during the fall, but up to 14,000 were on the St. Lawrence River at Coles Creek State Park during early December, and on 5 December two **Ross's Goose** were among them. Trumpeter Swans continue to increase at all seasons, as evidenced by a Regionally high count of 42 at Wilson Hill WMA on 16 December. Unfortunately, Mute Swans are also increasing in the Region, most noticeably during winter along the St. Lawrence River near Wellesley Island, where 207 were counted on 2 February.

Despite the presence of open water throughout the winter, waterfowl numbers seemed quite poor along the Lake Ontario shore, and ducks were scarce at all but a few favored locations. However, dabbling ducks lingered in unusually high numbers at and near Whalen Park on the St. Lawrence River into early January. For instance, counts of more than about five pintail are exceedingly rare anywhere

in Region 6 during winter, but as many as 127 were at Whalen Park to at least 8 January. Other dabblers present in higher than usual numbers included Gadwall, Northern Shoveler, and Green-winged Teal. During the mid-winter waterfowl count on 16 January one each first-winter male **Harlequin Duck** was at Tibbetts Point and Lisbon Beach, more than 60 miles apart, the only reports of the season of this Regionally rare duck. The season's only Barrow's Goldeneye, a female, was at Hawkins Point in early January.

For the second consecutive year white-winged gulls put in a dismal showing, with just one Iceland Gull and two Glaucous Gulls. A Little Gull at Pillar Point 1 December and a Lesser Black-backed Gull on the St. Lawrence River in Massena 31 December were the only other noteworthy gulls. Gull numbers seemed remarkably low on the St. Lawrence River for most of the winter, but good numbers of Herring Gulls and a few Ring-billed Gulls were on Lake Ontario through the season.

Raptor numbers were mostly down from the previous, very good winter, but many species were still present in average or higher numbers. Northern Harrier was especially down, with maximum counts of no more than three on Point Peninsula and Cape Vincent, where as many as 22 were seen daily last winter. Maximum counts for Rough-legged Hawk, Red-tailed Hawk, and Short-eared Owl were roughly half that of the previous winter. The season's only Northern Goshawk, an immature, was on Point Peninsula on 21 January. A **Black Vulture** over Adams and a Golden Eagle over Leray were the only reports for each species, both occurring on 20 February. Black Vultures are rarely reported in Region 6 but probably occur more frequently than reports suggest given increases elsewhere in northern New York and Ontario.

It was a good winter for half-hardies, perhaps not surprising given the mild start to the winter. At least five Yellow-bellied Sapsuckers, three Winter Wrens, and four Hermit Thrushes continue a string of winters each species has been documented, suggesting that they now occur annually in winter. This was also the fifth consecutive winter that Gray Catbird has been observed; during the previous decade catbirds were reported no more than once every two or three winters. The six Red-headed Woodpeckers that successfully overwintered at Fort Drum represents a seasonal high count for Region 6, but was not unexpected given this year's bumper acorn crop.

The season's tally of three warbler species was certainly the highest Region 6 winter tally in the last 20 years and likely is unprecedented. Completely unexpected was a Black-throated Green Warbler Dick Brouse and Rachel Lewis found on Point Peninsula **14 January** and that remained to at least **19 January**. Somewhat less surprising but still unexpected was a Common Yellowthroat on Fort Drum 5 January that was not found again. The extensive red cedar stands near Lake Ontario and more locally along the St. Lawrence River included many cedars loaded with berries, so the presence of scattered small groups of Yellow-rumped Warblers was not a surprise. However, it is not clear whether these birds made it through the winter, as large flocks of European Starlings apparently

decimated the berry crops in many cedar stands, and by mid-February few cedar berries seemed to be present and Yellow-rumped Warblers were hard to find.

Crossbill numbers in southeast St. Lawrence County were disappointing given the reportedly historic irruption reported elsewhere in the Adirondacks. Red Crossbills and White-winged Crossbills were observed in several places and almost certainly nested in the Region, but at most locations were only seen as flyovers or obviously transient individuals, and none were found in many places where nesting has been confirmed in previous years. Cone crops seemed mostly poor in the northwest Adirondacks, especially north of State Highway 3, and other than a couple of locations near Wanakena there seemed to be little evidence that either crossbill nested in Region 6. Among other finches, Pine Siskin and Common Redpoll were widespread in low numbers, and there were just three reports of Evening Grosbeak and six reports of Pine Grosbeak.

The 123 species reported this winter is a little more than four higher than the most recent 10-year mean. The abundance of half-hardies and presence of seasonally rare songbirds like Black-throated Green Warbler and Common Yellowthroat accounted for the relatively high total. There were no truly outstanding rarities, with Harlequin Duck, Ross's Gull, and Black Vulture representing the rarest species of the season. Perhaps the season's big disappointment was relative scarcity of crossbills given the widespread nesting event documented throughout much of the Adirondacks.

## REGION 7—ADIRONDACK-CHAMPLAIN

### Bill Krueger

40 Colligan Point Rd, Plattsburgh, NY 12901  
billkrueger@hotmail.com

### Derek Rogers

54 Corlear Drive, Willsboro, NY 12996  
drogers0031@gmail.com

Precipitation in December (melted equivalent) ranged from 2-3" in almost all of the southern half of Region 7, the Champlain Valley and the eastern half of Franklin County. The rest of the Region got at least 3-4" except for the High Peaks Region and the area surrounding Lyon Mountain which got 4-5". The month was 3-5° warmer than normal throughout Region 7 apart from an area that included Lake Placid and Saranac Lake which was 1-3° warmer.

January's precipitation ranged from 1-2" in almost the entirety of Region 7. The exceptions were the extreme northwest which got only 0-1" and the High Peaks area which got from 2-3". The month was 5-7° colder than normal for all of Region 7 except for the southern halves of Hamilton and Essex Counties which were 3-5° colder than average. A deep freeze mid-month had an adverse impact on the annual waterfowl count. At end of the month and into 1 February, Winter Storm *Kenan* grazed the Region with minimum snow fall totals throughout.

The same was not true of two winter storms in February. Classed as a bomb cyclone, Winter Storm *Landon* dropped 12-14" in the northern Champlain Valley on the 4<sup>th</sup> and more in the higher elevations. Dooryard numbers soared as did sightings of gritting birds on roadsides, but no wind-driven birds were reported.

Snowfall totals for Winter Storm *Oaklee* on 25 February were similar. Temperatures for the month warmed over most of Region 7 to within a degree plus or minus of average. Only the northern half of Essex, the southwestern corner of Clinton, and the western portion of Hamilton Counties were 1-3° colder than normal. The highest elevations of Region 7, Lyon Mountain, the High Peaks, and southwestern Hamilton County, received 5-6" of precipitation with patches getting 6-7". Only the Champlain Valley and the western edge of Franklin County got less, at 3-4".

Despite an increased effort the total of 3,670 individuals in the annual waterfowl count on Lake Champlain and on inland lakes and rivers was lower than usual. The severe cold snap cited above in the week prior froze many of the interior lakes and rivers, froze the north end of Lake Champlain, and formed extensive ice shelves well out into the lake in the south. On the morning of the count the frigid air over the much warmer water formed a hovering mist that severely limited visibility. Despite all this, 18 species were recorded, highlighted by three sightings of Harlequin Ducks. Also notable for January were late Wood Duck, Gadwall, Northern Pintail and Red-breasted Merganser.

All or part of four CBCs were compiled in Region 7 in December. Plattsburgh's counted 53 species and 17,117 individuals. The highlight was a very late Baltimore Oriole which ultimately stayed all winter. The Saranac Lake CBC counted 2,715 individuals and 44 species. With its center in Vermont, Champlain Islands' CBC circle included a segment in Region 7, which added 31 species and 6,108 individuals. The New York side of the Ferrisburgh, VT CBC contributed three species not found by any other group, American Kestrel, Northern Shrike, and Red Crossbill.

The Winter Finch Forecast, (WFF) expected that White-winged Crossbill would irrupt this year with breeding likely. Sightings of this species in the Adirondacks of Region 7 abounded and included an early report of "male feeding behavior". As predicted Red Crossbills were abundant as well. According to Matt Young, president of the Finch Research Network, in the 20+ years that he's been doing crossbill work in New York State, the 2021-2022 winter has been the best overall year for both crossbill species at the same time. (See Notes and Observations pp. 134-135 for a more in depth account.) Some Purple Finches may have remained in Ontario as predicted, but there were more than 100 reports of this bird. Assessment of this prediction is complicated by their resident populations. Redpolls were expected "to stay north with some trickling later". The 75+ reports of Common Redpoll may or may not be a trickle, but this year's showing was nothing like the great irruption of the 2020-2021 winter season. Also, unlike last year, there were no reports of *rostrata* or either race of Hoary Redpoll. There were over 125 reports of Pine Siskin even though no southward movement was forecast. The expected limited movement south of Evening Grosbeak was borne out with fewer than ten reports from Region 7. Deemed unlikely to move south, Bohemian Waxwing was also reported fewer than ten times.

A **Mute Swan** found in late January lingered near the Essex Ferry for a month. It was the first record for Region 7 since the spring of 2008 when a pair, present for two weeks, was trapped and removed as a nuisance. **Tufted Duck** continued its recent streak of appearances covering the past nine years with sightings being reported through the end of February and into March from two widely separate locations. Adding to the collection of interesting *Aythya* species was an apparent Redhead x scaup sp. (hybrid) found at the south end of Lake Champlain in Bulwagga Bay on 30 December just off the western shore of Crown Point State Historic Site. In an embarrassment of riches at least two distinct **Harlequin Ducks** were discovered. The first involved an immature drake at Bulwagga Bay Beach in Port Henry on 30 December, where it favored the edge of a steep rock wall along the lake shoreline. On 10 January, a hen was discovered riding the icy rapids inside of the La Chute River in Ticonderoga where it remained through 10 February.

At least two **Razorbills** continued from the fall season at Crown Point State Historic Site following an unprecedented inland incursion of the species. Sightings on 2 and 5 December constitute a winter season first for Region 7 and added to the very short list of alcids recorded in the NY waters of Lake Champlain.

Herring x Great Black-backed Gulls (hybrid) continue their regular appearance at known gull congregations along Lake Champlain in Clinton and Essex Counties. Regular year-round sightings at the Boquet and Saranac River mouths prove Region 7 to be a relatively reliable area for studying these interesting hybrids. While their natal site remains a mystery, it's highly probable they originate from the Four Brothers Islands in the middle of Lake Champlain (Essex County), approximately 5.5 miles northeast of Willsboro.

Four reports of **Golden Eagle** were a strong showing. A **Snowy Owl** was present for several days at the north end of the lake in Clinton County in mid-December. There were also two reports of Snowy Owls from the south end of the lake in Essex County. Both Essex County birds were photographed, which solidified the distinction between both individuals. The **Long-eared Owl** found in the Willsboro area at the end of December was the only winter record in more than 20 years. The bird was found in a large, overgrown hayfield adjacent to a substantial, mature red cedar forest. There is no way of knowing whether the scarce detection of Long-eared Owls in Region 7 is in any way a reflection of the deliberate killing of 162 individuals on Valcour Island in a predator control program in the 1940s (*The Kingbird* 1989: Vol. 39, No. 1, p. 24).

A Hermit Thrush was photographed at Willsboro Bay Marina on 30 January and marked a first January record for this species in Region 7. In addition, there are no February records of Hermit Thrush. Only a handful of winter season records exist, with the previous late date being 30 December 2021.

A couple of additional hardy late-season birds were discovered this season. An adult male Rose-breasted Grosbeak was photographed at a backyard bird feeding station on 4 December in Saranac Lake and constitutes the first winter season record for this species in Region 7. A bright adult male Baltimore Oriole

overwintered in Plattsburgh with the aid of a private feeding station, yet another winter season first for Region 7.

## REGION 8—HUDSON-MOHAWK

**Tom Williams**

153A Consaul Rd., Albany, NY 12205

trwdsd@fastmail.fm

The 2021-2022 winter season was one of sharp contrasts and sudden reversals. December 2021 was much warmer than normal and could only muster four inches of snow at Albany. The last ten days of the year, and the first two of 2022, were a remarkable eleven degrees above normal and suggested a warm, wet winter was in the cards. But as so often happens, the atmosphere had other ideas. The remainder of January suddenly turned relentlessly cold, almost without respite. It was also very dry, with Arctic air masses dominant and no coastal storms affecting the area. February flipped the script once again, with a rollercoaster of alternating

warm and cold stretches, but only eleven inches of snow. Needless to say, once the cold arrived for good in early January, water bodies froze over and stayed that way through the end of the period.

	Albany			Glens Falls		
Temp	Mean	Normal	Deviation	Mean	Normal	Deviation
Dec	36.1°	30.4°	+5.7°	31.9°	26.6°	+5.3°
Jan	19.7°	24.4°	-4.7°	15.5°	19.7°	-4.2°
Feb	27.5°	26.8°	+0.7°	23.4°	21.9°	+1.5°

Precip	Total	Normal	Deviation	Total	Normal	Deviation
Dec	2.65"	3.26"	-0.61"	2.53"	3.01"	-0.48"
Jan	1.28"	2.60"	-1.32"	0.65"	2.56"	-1.91"
Feb	2.77"	2.28"	+0.49"	2.99"	1.95"	+1.04"

Rarities were just that, rare this winter season. The Bird of the Season was the **Razorbill** seen briefly on Lake Champlain in far northern Washington County on 13 December. Gary Chapin observed it and provided a well-documented report of the sighting. A pair of **Sandhill Cranes** spent a week roosting along a section of Mohawk River backwater in Halfmoon, Saratoga County, where a pair had also spent time during the early winter in several previous seasons.

A lone **Canvasback** was spotted at the Schoharie Crossing Boat Launch in Montgomery County on 22 January. **White-winged Scoters** were reported from Saratoga Lake, Cossayuna Lake (Washington County), and Snyder's Lake (Rensselaer County) in December. A **Virginia Rail** was present again this winter during the Chatham CBC, in a cattail marsh along the Hudson River in Stuyvesant, Columbia County. It responded to playback, as it had the previous year. **Iceland Gull** seemed more widespread, in small numbers, than in recent years, with reports from Fulton, Montgomery, Saratoga, and Albany Counties. **Lesser Black-backed Gull** was hard to find, with the only reports from the Mohawk River, Cohoes in mid-January, and Schoharie Crossing Boat Launch in Montgomery County on the last day of February. **Glaucous Gulls** were observed at Round Lake in Saratoga County, and along the Cohoes-Crescent corridor in Albany County. **Snowy Owls** were not as abundant as in recent years, but they were reported from Montgomery, Greene, and Albany Counties, and as usual from the Ft. Edward Grasslands Area in Washington County where two were noted during much of the winter. **Short-eared Owls** were found in their strongholds in Greene, Montgomery, and Washington Counties. The highest number reported from the Ft. Edward Grasslands was nine on 8 January.

Among the unusually late reports this season were **Marsh Wrens** at a farm pond along the Hudson River north of Coxsackie, Greene County on 18 December, and on 2 January from South Bay, Hudson, Columbia County. **American Pipits** were observed along the Hudson River corridor in Saratoga County during all three winter months this year, which might be unprecedented, at least in recent times, looking at CBC data. Rich Guthrie had a very late

**Nashville Warbler** in his yard on 21 December, in New Baltimore, Greene County. **Common Yellowthroats** lingered into December in two locations, with the unseasonable warmth very much in their favor. A **Cape May Warbler** showed up at a bird feeder in Poestenkill, Rensselaer County on 9 December and hung around until at least the 18<sup>th</sup> of the month.

**Common Redpolls** and **Red Crossbills** did not venture very far south of the international border this winter, with just a few observations locally, mostly at bird feeders in the case of the former.

## REGION 9—HUDSON-DELAWARE

**John H. Haas**

98 North Shore Dr., Wurtsboro, NY 12790

vanhaas@citlink.net

December was mild with a high of 67° F on 16 December and a low of 16° on 20 December, an average of 5.4° above normal. There was a total of 1.81" of precipitation, 1.58" below normal. This made for a warm, dry month with almost no snow. January found us in a deep freeze. The morning of the mid-winter waterfowl count, 16 January, dawned at -6°. The following morning the first major snowstorm of the winter dropped up to 9" of snow on the Region. That wouldn't be the end of the cold. 22 January dawned at -10°. There would be three more mornings below zero before the end of the month. The Poughkeepsie site showed temps more in the zero range which was obviously affected by the river and the lower elevation. They showed a high of 54° on 1 January and a low of -3° on 30 January. This gave us an average temperature 23.7°, 3.4° below normal. These were by far the coldest temperatures in the Region in many years. We had a total of 1.22" of precipitation, falling mostly as light snow. This was 1.6" below normal. The long-range forecast for February was above normal temperatures, but 1 February found us at -1°. A major storm hit the Region on 4 February with considerable ice to the north and rain further south. Ulster County had extensive damage that took weeks to clean up. The Poughkeepsie site showed a high of 68° on 23 February and a low of 1° on 1 February with an average temperature of 30.8°, 1.6° above normal. There was a total of 3.07" of precipitation, .86" above normal.

Greater White-fronted Geese were found around the Region from the very beginning of the period. On 14 January Debbie van Zyl was scanning the Canada Geese in Wappingers Falls when she picked out one each of Greater White-fronted Goose and **Pink-footed Goose**. At least one Cackling Goose continued in the Black Dirt Region of Orange County at the beginning of the period. On 11 January Chris Chappell noted a **Ross's Goose** at Sand Dock Road Trail in

Dutchess County; following a period of absence, it was relocated and seen by many. On 10 January R Miller picked a female **Barrow's Goldeneye** out of a flock of Common Goldeneye on the Hudson River in Ulster County. The bird was later seen from Dutchess County as well and continued through the period.

An extraordinary winter gull season got off to a great start when Bruce Nott spotted the adult Iceland Gull, continuing from the fall period, from the Newburgh Waterfront on 4 December. Lesser Black-backed and Glaucous Gulls were seen on both sides of the river as well. On 17 February Ari Weiss spotted a **Little Gull** as it landed off Piermont Pier. The Regional mega-rarity remained just long enough for him to get some identifiable photos and was gone. The highlight of the season, though, occurred on 16 December when Ronnie DiLorenzo picked a **Franklin's Gull** out of a flock of Ring-billed Gulls on the Newburgh Waterfront. The bird developed a pattern and was easily viewed at the Newburgh Sewage Treatment Plant when not on the water or at the launch. Uncharacteristically for the species, the bird continued through 8 January. On 4 January Sean Camillieri spotted an unusual gull on the Hudson River which turned out to be a **Black-legged Kittiwake**. Bruce Nott was able to get some identifying shots of this extreme rarity for the Region. Fortunately, several others were able to see the bird before it disappeared.

On 4 December Matt Zeitler found a Snowy Owl perched on the New York Waterways Ferry on the Newburgh Waterfront. It remained only that afternoon but was viewed by many.

On 18 December Richard Leonard came upon a flycatcher at Rockefeller State Park that he didn't recognize. Realizing it was something different, he took several photos identifying it as an **Ash-throated Flycatcher**! This is a mega-rarity for Westchester and Region 9, with only one previous historical record from 1970 (Fritz & Quinlan, *Bull's Birds of New York State*, 1998, p. 370-371). The bird was relocated on 24 December by Steve Rappaport, enabling others to see it as well. It continued through 1 January but was not seen thereafter.

On 2 December Dave Chernack saw a Northern Shrike at the Shawangunk Grasslands NWR. This was the first of many reports this season.

On 11 January Jim Yates photographed a bluebird at Esopus Meadows Park that was determined to be a **Mountain Bluebird**. Once word got out the bird was very cooperative, spending much of its time there and in Esopus Meadows Lighthouse Park right in the parking lot.

On 23 January Mary Buskey was photographing Song Sparrows along her road when she realized one of the birds was in fact a Vesper Sparrow; rare in the Region in winter, it was viewed by several birders in the following days. On 2 December Charlie Roberto found two **LeConte's Sparrows** at Croton Point Park, at least one continuing from the fall. They remained through the end of the month. On 17 January Jeanne Cimorelli was watching some birds feed along Station Road in Campbell Hall, Orange County when she spotted a bird she didn't recognize. Merlin identified it as a **Lark Sparrow**, and she put the word out. This species is

often accommodating, and it was exactly that for much of its stay through 30 January.

On 4 December Jodi Brodsky had a Baltimore Oriole on her feeders. The bird continued into January and was the first of several reports. On 16 December Leon Meintjes discovered a flock of six Boat-tailed Grackles on Glen Island Park in Westchester County. Eamon Corbett relocated them on 23 December, then numbering eight birds which matched the previous high count for the county. The birds continued sporadically into January.

On 17 December a small group of warblers was found along the Hudson River near the Newburgh Sewage Treatment Plant while birders were observing the gulls. A Yellow Warbler was the most unusual among them. They not only continued into January, but on 8 January Curt McDermott was observing them when he saw a Tennessee Warbler had joined the group.

On 24 December Kim Gragert spotted an unusual bird feeding in a juniper in Putnam Valley. She identified it as a **Western Tanager**, but it wasn't until 9 January that she saw it again and was able to get excellent photos of the bird. Unfortunately, it only returned sporadically and was unable to be viewed by others. On 7 February a photo was posted to Facebook requesting identification of a beautiful **Black-headed Grosbeak** that had come to a private feeder in Westchester County on 6 February but never returned. On 11 January Bob Howard noted an unusual bird in a mixed flock feeding in a cornfield on Rte. 209 in Ulster County. The bird was a bunting, but much discussion ensued as to which bunting. It was ultimately confirmed to be a first year Indigo Bunting, an exceptional find at this time of year.

Jan	4.29"	3.64"	+0.65"	5.37"	3.66"	+1.71"
Feb	3.23"	3.19"	+0.04"	3.61"	3.29"	+0.32"

As in recent years, December was warm, with temperatures generally in the 40s; the first, evanescent, snowfall was on 24 December. Only in January did the temperature drop into the 20s, the average in late January and early February. A blizzard on 29 January was the only heavy snowfall.

Among the usual wintering waterfowl, the low abundance of some species was notable. The fall-off of Common Eider was most striking: only 39 were tallied on the Montauk CBC (usually over 2,000), and the usual high numbers at Shinnecock Inlet reached a maximum of only 64 in late February. Likewise, only 232 Surf Scoters and 1,271 Black Scoters were recorded on the Montauk CBC, well below counts in recent years, and the highest reports from Long Island after that were 48 Surf and 350 Black Scoters at Montauk. White-winged Scoters, however, showed much their usual abundance in Long Island Sound. The

Southern Nassau CBC recorded low counts for all these species and for Bufflehead (90, down from a ten-year average of 315), Greater Scaup, Long-tailed Duck, and Ruddy Duck, as well as Red-throated Loon and Common Loon (only three, compared to the previous minimum of 94). The decline of Tundra Swan was complete: the small numbers that have long overwintered at Hook Pond (Suffolk) finally dwindled to zero.

Some respectable tallies of Greater Scaup were recorded, including 5,000 at the East Islip Marina (Suffolk) on 19 December. The maximum count of Lesser Scaup was 2,000 in Babylon (Suffolk). The abundance of other *Aythya* species was about average, although a count of 390 Canvasback in Queens was heartening for this declining species. A Tufted Duck x scaup hybrid at the same location was noteworthy. Robust numbers of Green-winged Teal and Wood Duck (62 lingering on the Bronx Zoo grounds until late February) were recorded, but American Wigeon has declined in many areas. Among uncommon but expected species were single Blue-winged Teal in five locations, Eurasian Wigeon in four, and Harlequin Duck in eight, with an exceptional high count of seven in Red Hook (Kings). At least 34 Cackling Geese were spotted, mostly in large flocks of Canada Goose.

Other than *Anatidae*, water birds from the north included Horned Grebe, mostly in modest numbers, and single Red-necked Grebes at eight locations across the length of the Region. A high count of 61 Common Loons at Breezy Point (Queens) was not exceptional, but the 94 Red-throated Loons at Hook Pond (Suffolk) was notable. Among alcids, as many as nine Dovekies were recorded among several sightings, mostly at Montauk; among many reports of Razorbill, a maximum count of 226 signaled a return to the norm from last winter's plenty. Thick-billed Murres were seen at at least seven locations from Kings to Suffolk, at least one Black Guillemot was reported at Culloden Point near Montauk, and there were single reports of Common Murre and Atlantic Puffin (both offshore). Great Cormorants were seen at five traditional locations in Bronx, Kings, and Suffolk. Only a few sightings of Black-legged Kittiwake were reported, all from Montauk, and although Bonaparte's Gulls were seen at many sites, the maximum count was only 90 (at Ditch Plains, a traditional site in Suffolk); this species has shown a pronounced, steady decline. Lesser Black-backed Gull, in contrast, is overwintering in small but increasing numbers, while the plentiful reports of Iceland and Glaucous Gulls suggest they are holding steady or perhaps increasing. A puzzling gull found by Patrice Domeischel at Oldfield Point (Suffolk) was likely a Herring Gull of the European subspecies (*Larus argentatus argentatus*), as explained in the Notes and Observations article on pp. 136-139.

Land birds visiting the Region from farther north included several Rough-legged Hawks and a multitude of Snowy Owls, reported from at least 40 locations in all counties except New York; five birds were seen on 22 December at Smith Point County Park (Suffolk) and at least three were seen near Shinnecock. Most other owl sightings are (properly) not in the public record, but eBird reports do include a Long-eared Owl in Green-wood Cemetery, Kings, and single Short-

eared Owls at six locations; however, the numbers at EPCAL, the former Grumman site (Suffolk) have declined over the last few years to one in winter 2020-2021 and zero in 2021-2022. Northern Saw-whet Owls were reported from at least 11 locations in four counties, with multiple birds heard at several sites. Barred Owl is not known to breed in the Region at this time, but there were several reports of one, probably the same bird, at Pelham Bay Park (Bronx). Barn Owl is known to be resident at several sites in the Region.

Of the two Northern Shrikes found in the Region, one stayed throughout the period on the North Fork of Long Island and another was seen in Nassau. Lapland Longspurs were seen at six sites in Queens and Long Island, and eight were seen on the CBC in Staten Island. The distribution and numbers of Snow Buntings and of American Tree Sparrows were similar to those in recent years. The most notable sparrow numbers were of White-throated Sparrow, which was exceptionally abundant in many areas; for example, the Southern Nassau CBC recorded 1,285, contrasting with the 10-year mean, 490. Red-breasted Nuthatch was abundant for the second winter in a row. There were many records of Purple Finch, although nowhere in abundance; similarly, of the many, widespread reports of Pine Siskin, all except one were single-digit counts. Single Red Crossbills were seen at Jamaica Bay and central Suffolk, and there were two single-digit reports of White-winged Crossbill. A single redpoll, of undetermined species, flew over Jamaica Bay Wildlife Refuge.

Many warm-weather species lingered at least into the early, warmer part of the winter. Among water birds and shorebirds were good numbers of Wood Ducks in a few locations, four Blue-winged Teal, Clapper Rail in seven locations and Virginia Rail also in seven, and two Common Gallinules (one returning for at least the third winter). Among the expected shorebirds were American Oystercatcher, Black-bellied Plover, Killdeer, Ruddy Turnstone, Red Knot, Long-billed Dowitcher (six returning to their usual site in Nassau), Greater Yellowlegs, and Wilson's Snipe. There were 49 Regional reports of American Woodcock between 1 December and 17 February, and 87 in the 11 days thereafter, perhaps including some returning migrants. More unexpected were Semipalmated and Piping Plovers in mid-winter, a Whimbrel, Western and Least Sandpipers, Short-billed Dowitcher, and Lesser Yellowlegs. Lingering larids included Laughing Gulls and a single Black Skimmer. American Bitterns were seen at five locations, and Great Egrets were widespread, especially in December. More unusual were Snowy Egrets at four sites, one of which stayed through the season; two Cattle Egrets; a Green Heron on 27 December; and Yellow-crowned Night-Herons at five sites, with one on Randall's Island until at least 9 February.

Among the many lingering land birds were at least 11 Ospreys, as late as 9 February, and a Broad-winged Hawk in January. Tree Swallows were abundant at certain shore points, as usual. Large flocks of Red-winged Blackbird, Common Grackle, and Brown-headed Cowbird were seen in Suffolk, although the maximum count of Common Grackle (2,245) was in Manhattan. Flocks of 100 or more Boat-tailed Grackles, a relative newcomer to the Region's winter avifauna,

were seen at 25 sites in five counties. Eastern Meadowlark occurred in suitable sites throughout the Region. Gray Catbird was abundant; for example, 49 were tallied on the Southern Nassau CBC, well above the recent average of 14. Eastern Bluebird was reported from 73 sites in Suffolk and 10 sites elsewhere, with a maximum of 47 in East Hampton. Less common or unusual lingering species included several Blue-headed Vireos, Marsh Wrens, Yellow-breasted Chats, and Baltimore Orioles, and single Blue-gray Gnatcatcher, Veery, and Wood Thrush.

Among notable sparrows were several reports each of Chipping, Clay-colored, Vesper, Lincoln's, Grasshopper, and Saltmarsh, as well as single Lark and Seaside Sparrows. A remarkable list of 15 species of warblers was compiled over the season, including not only the expected Yellow-rumped, Palm, Pine, and Orange-crowned Warblers, but also Ovenbird, Black-and-white, Nashville, Common Yellowthroat, American Redstart, Cape May, Northern Parula, Blackpoll, Black-throated Blue, Prairie, and Wilson's Warblers. Five Dickcissels were reported in as many counties. Although our corvids are seen year-round, Fish Crow numbers decrease during winter. The only reported roosting aggregation of this species was in Garden City (Nassau), where 2,200 were estimated on 11 February. The maximum number of American Crows reported was 163. Common Raven is now abundant and ubiquitous throughout the Region.

Having saved the good wine for last, we turn to uncommon or rare species. At least seven Barrow's Goldeneyes were found, including a male returning to Crab Meadow Beach (Suffolk) for at least a fourth winter. Single male King Eiders lingered at Shinnecock Inlet and at Great Kills Park (Richmond) throughout the season. Six Sandhill Cranes flew over Pelham Bay Park in December. At least one Western Kingbird frequented the Lake Montauk area at the same time as an Ash-throated Flycatcher in Owl's Head Park (Kings), but surely the Gray Kingbird in Great Kills Park in Richmond was the star tyrannid. Two Western Tanagers were found in Manhattan (New York); the one in Carl Schurz Park was almost certainly the same bird as last winter's. A Henslow's Sparrow in Greenwood Cemetery (Kings) was most unusual. A Pacific Loon photographed in Bayard Cutting Arboretum (Suffolk) unfortunately drifted downstream and could not be refound. At least six Black-headed Gulls were spotted in four counties, and two Short-billed Gulls (split from Common) were found in Staten Island and along the Brooklyn shore. One candidate for the title of rarest was an adult Slaty-backed Gull that frequented the Jacqueline Onassis Reservoir in Central Park for about three weeks, photographed first by Brad Balliett and called to wide attention by Evan Schumann. The other candidate was the one-day Northern Lapwing found by Mike Vedder on 18 December at Santapogue Creek in Babylon, and relocated, after it flew out, by Tim Healy on a golf course to the east. Winter in Region 10 is always rewarding!

## EXOTICS

**European Goldfinch:** PP 12 Dec-27 Jan (1-3 birds); Arthur Sommers P KING 28 Dec - 2 Feb (2 birds); GwC 16-26 Dec (1 bird).

## REPORTING YOUR OBSERVATIONS

Observers are strongly encouraged to report their findings directly to the Regional Editors, to help identify significant trends. Summary reports of observations; impressions of notable patterns in the weather, timing of migration, unusual scarcity or abundance of particular species, etc.; and notable individual records are highly valued. For maximum usefulness, send in reports no later than the 15<sup>th</sup> day of the month following the end of each season:

15 March, 15 June, 15 September, and 15 December.

## STANDARD ABBREVIATIONS

Regional rarities appear in **BOLD**; county names are shortened to their first four letters and appear in **UPPER CASE** letters; months are shortened to their first three letters. In species accounts: number of individuals omitted implies that one individual was reported; ! – details seen by Regional Editor; ad – adult; alt – alternate plumage; arr – arrival or first of season; BBS – Breeding Bird Survey; BOTS – bird of the season; CBC – Christmas Bird Count; Co – County; I – Island; imm – immature; intro – see introduction to report; juv – juvenile; L – Lake; max – maximum; mob – multiple observers; Mt – Mountain; NYSDEC – New York State Department of Environmental Conservation; NWR – National Wildlife Refuge; NYSARC – report to New York State Avian Records Committee; P – park; Pd – Pond; ph – photographed; Pres – Preserve; Pt – Point; Res – Reservoir; Ri – River; SP – State Park; spm – specimen; subad – subadult; T – Town of; thru – throughout period; Twn – township; WMA – Wildlife Management Area; y – young.

## BREEDING BIRD ATLAS CODES

These codes are listed in ascending order to highest breeding codes.

**POSSIBLE:** H – in appropriate habitat; S – singing bird.

**PROBABLE:** S7 – singing male present 7+ days; M – multiple (7+) singing males; P – pair in suitable habitat; T – territorial defense; C – courtship, display, or copulation; N – visiting probable nest site; A – agitated behavior; B – woodpecker/wren nest building.

**CONFIRMED:** PE – physiological evidence; CN – carrying nesting material; NB – nest building; DD – distraction display; UN – used nest; ON – occupied nest; FL – recently fledged and precocial young; CF – carrying food; FY – feeding young; FS – carrying fecal sac; NE nest with eggs; NY – nest with young.

## REPORTING REGIONS

Regional boundaries coincide with county lines, except at:

Region 1-Region 2 in Orleans, Genesee and Wyoming Counties:

the boundary is NY Route 98 from Pt. Breeze to Batavia; NY Route 63 from Batavia to Pavilion, and NY Route 19 from Pavilion to the Allegany County line.

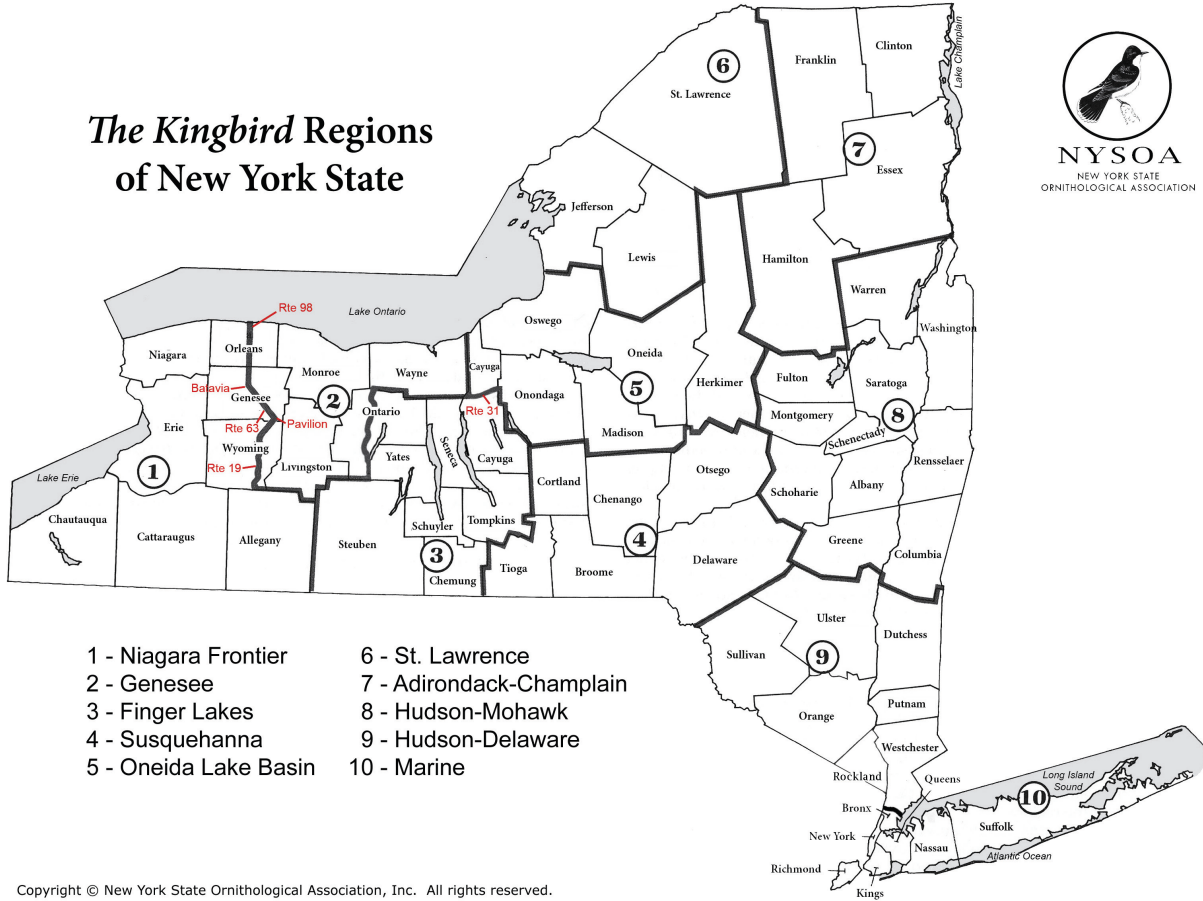

Region 2-Region 3 in Ontario County:

the boundary is Mud Creek to NY Route 64, NY Route 64 from Bristol Center to S. Bristol Springs, and Route 21 from S. Bristol Springs to the Yates County line.

Region 3-Region 5 in Cayuga County:

the boundary is NY Route 31.
